

CMOS 4-BIT MICROCONTROLLER

TMP47C446AF

The 47C446A has LCD driver, 8-bit A/D converter, and watchdog timer based on the TLCS-47 CMOS series. The 47C446A has two oscillation circuit. It is possible to switch the operation mode; high speed operation and low power consumption operation.

PART No.	ROM	RAM	PACKAGE	PIGGYBACK
TMP47C446AF	4096 x 8-bit	256 x 4-bit	QFP64	TMP47C946AG

FEATURES

- ◆ 4-bit single chip microcomputer
- ◆ Instruction execution time : 1.9 μ s (at 4.2MHz)
- ◆ 89 basic instructions
- ◆ Table look-up instructions
- ◆ Subroutine nesting : 15 levels max.
- ◆ 6 interrupt sources (External : 2, Internal : 4)
 - All sources have independent latches each, and multiple interrupt control is available
- ◆ I/O port (24 pins)
 - Input 1port 4pins
 - I/O 4ports 20pins
- ◆ Interval timer
- ◆ Two 12-bit Timer/Counters
 - Timer, event counter, and pulse width measurement mode
- ◆ Watchdog Timer
- ◆ Serial Interface with 4-bit buffer
 - External/internal clock, leading/trailing edge shift mode
- ◆ LCD driver (automatic display)
 - LCD direct drive (Max. 12-digit display at 1/4 duty LCD)
 - 1/4, 1/3, 1/2 duty or static drive are programmably selectable.
- ◆ 8-bit successive approximate type A/D converter
 - With sample and hold
 - 4 analog inputs
 - Converting time : 48 μ s (4MHz)
- ◆ Dual-clock operation
 - High-speed/Low-power-consumption operating mode
- ◆ Real Time Emulator : BM47220A

OPERATIONAL DESCRIPTION

Concerning the 47C446A, the hardware configuration and operation are described. As the description included mainly differences from the 47C400A, refer to the technical data sheets for the 47C400A. The 47C446A does not have the hold function.

1. SYSTEM CONFIGURATION

- (1) I/O Ports
- (2) System Clock Controller
- (3) Interval Timer
- (4) Timer/Counter (TC1, TC2)
- (5) Serial Interface
- (6) LCD Driver
- (7) A / D Converter
- (8) Watchdog Timer

2. PERIPHERAL HARDWARE FUNCTION

2.1 Ports

The 47C446A has 7 I/O ports (24 pins) each as follows :

- ① K0 ; 4-bit input
- ② R4 ; 4-bit input/output (shared by the A/D converter analog inputs)
- ③ R5, R6 ; 4-bit input/output
- ④ R7 ; 1-bit input/output (shared by the watchdog timer output)
- ⑤ R8 ; 4-bit input/output (shared by external interrupt request input and timer/counter input)
- ⑥ R9 ; 3-bit input/output (shared by serial port)

This section describes ports of ② and ④ which are changed from the 47C400A.

Ports P1, P2 and KE are eliminated from the 47C400A.

The 5-bit to 8-bit data conversion instruction [OUTB @HL] is not valid.

Table 2-1 lists the port address assignments and the I/O instructions that can access the ports.

(1) Port R4 (R43-R40)

Port R4 is 4-bit I/O ports with latch shared by the analog inputs for A/D converter. When used as an input port or analog input, the latch should be set to "1". If other port is used as an output, be careful not to execute the output instruction for any port during A/D conversion in order to keep accuracy of conversion. The latch is initialized to "1" and analog input is selected R40 (AIN0) pin during reset.

Table 2-1. Port Address Assignments and Available I/O Instructions

(2) Port R7 (R70)

Port R7 is 1-bits I/O port with latch. R70 pin is shared by the watchdog timer output. To use R70 pin for the watchdog timer output, the latch should be set to "1". The latch is initialized to "1" during reset. R71, R72 and R73 pins do not exist actually but "1" is read when an input instruction is executed.

Figure 2-2. Port R7

2.2 System Clock Controller

The 47C446A has two oscillation circuits with a high-frequency clock and a low-frequency clock. Power consumption can be decreased by switching to low-speed operation using the low-frequency clock when necessary (dual clock operation). The high-frequency clock can be obtained by connecting an oscillator to the XIN and XOUT pins; the low-frequency clock can be obtained by connecting the oscillator to the XTIN and XTOUT pins.

2.2.1 Circuit Configuration

Figure 2-3 shows the configuration of system clock controller.

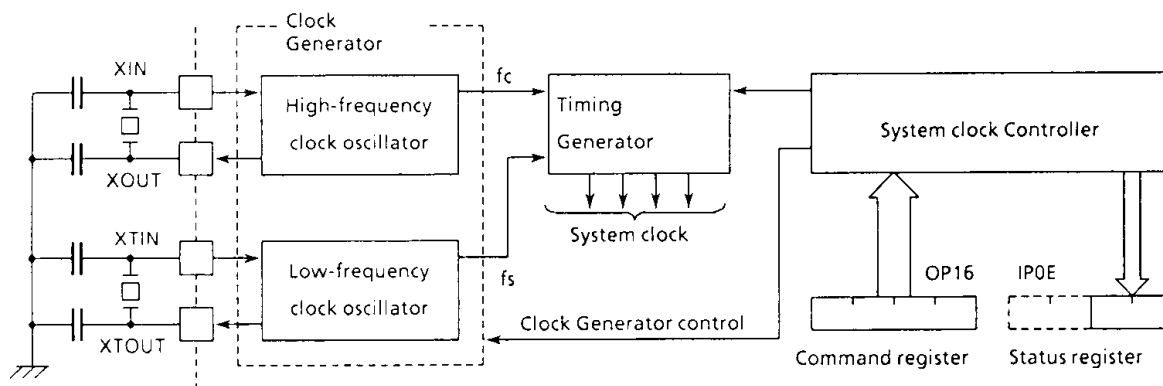

Figure 2-3. System Clock Controller

2.2.2 Dual Clock Operation and Control

Dual clock operation involves two modes : Normal operating mode using the high-frequency clock, and SLOW operating mode using the low-frequency clock. Both oscillators start operating when the power is turned on, after which the Normal operation is selected automatically. The high-frequency clock stops oscillating when a command is issued to switch to the SLOW operation. Operating mode switching is performed using the command register (OP16). The status of the low-frequency clock and the current operating mode can be monitored using the status register (IP0E) . Figure 2-4 shows the operating mode transitions, and Figure 2-5 shows the command and status registers.

(1) Operating Mode Transmission

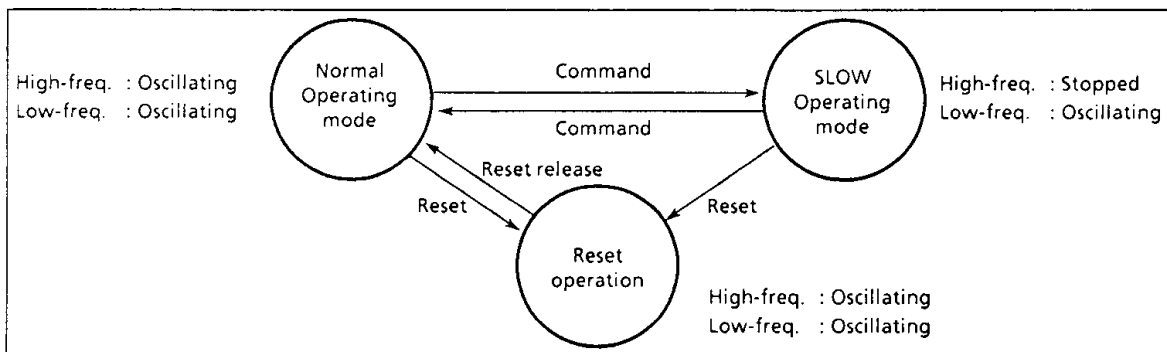

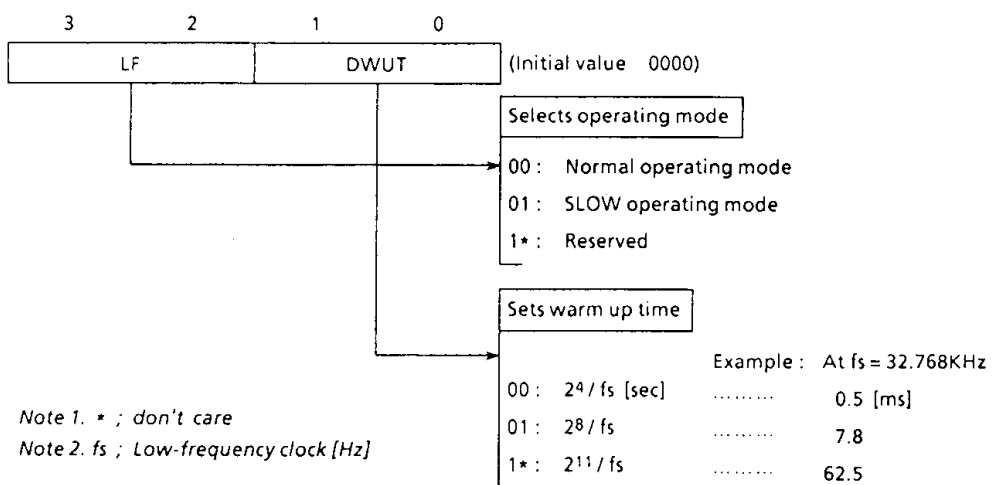

Figure 2-4. Operating Mode Transmission Diagram

(2) Operation Mode Control

System clock control command register (Port address OP16)

System clock control status register (Port address IPOE)

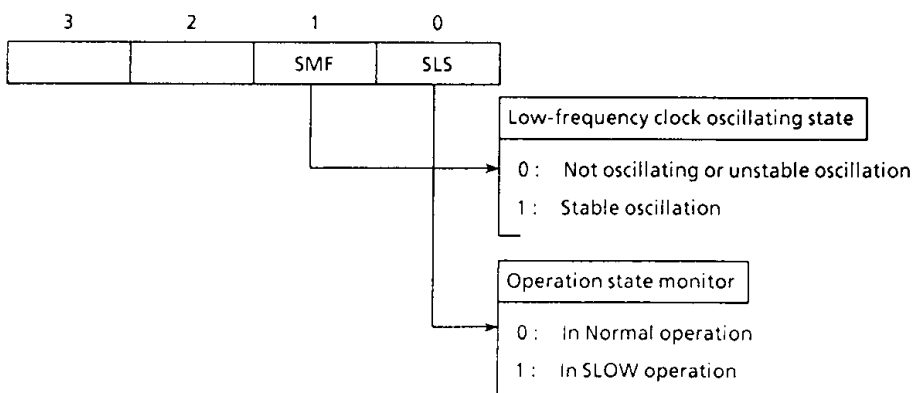

Figure 2-5. Command register and Status register

Note 1. The following operations and functions cannot be used in the SLOW operation ; therefore, this must be taken into consideration in programming.

- ① Timer/Counter 4096Hz (at $f_s = 32.8\text{kHz}$) count operation (can be used with other count rates).
- ② Interval timer interrupt 4096Hz (at $f_s = 32.8\text{kHz}$) operation (can be used with other timer rates).
- ③ Serial Interface

Note 2. The power consumption of the oscillator and internal hardware is decreased in the SLOW operation, but power consumption through pin interfaces (dependent on the external circuitry and program) may prevent overall low power consumption operation ; therefore, caution is necessary during system design and interface circuit design.

(3) Operation mode switching

The following procedure is used to switch between the Normal operation and the SLOW operation. The Normal operation is selected during reset. Also, the current operating mode can be checked by monitoring SLS (status register bit 0).

a. Switching from Normal operation to SLOW operation

After monitoring SMF (status register bit 1) by program and confirming that the low-frequency clock is stable, set bit 2 of the command register to "1". The high-frequency clock will then stop. Also, after switching from Normal operation to SLOW operation (accessing the command register), execute the NOP (No Operation) instruction.

b. Returning from SLOW operation to Normal operation

When bit 2 of the command register is cleared to "0", the warm-up time must be set in DWUT. When the set warm-up time elapses, operation is switched to the Normal operation.

Example 1 : Normal operation → SLOW operation.

```

SSMF:   TEST    %IPOE, 1      ; To wait until SMF goes to "1" .
        B       SSMF
        LD      A, #0100B     ; Selects SLOW operating mode
        OUT    A, %OP16
        NOP
        :
    
```

Example 2 : SLOW operation → Normal operation

```

        LD      A, #0001B     ; Selects Normal operation and sets warm-up
        OUT    A, %OP16       time (7.8ms)
        :
    
```

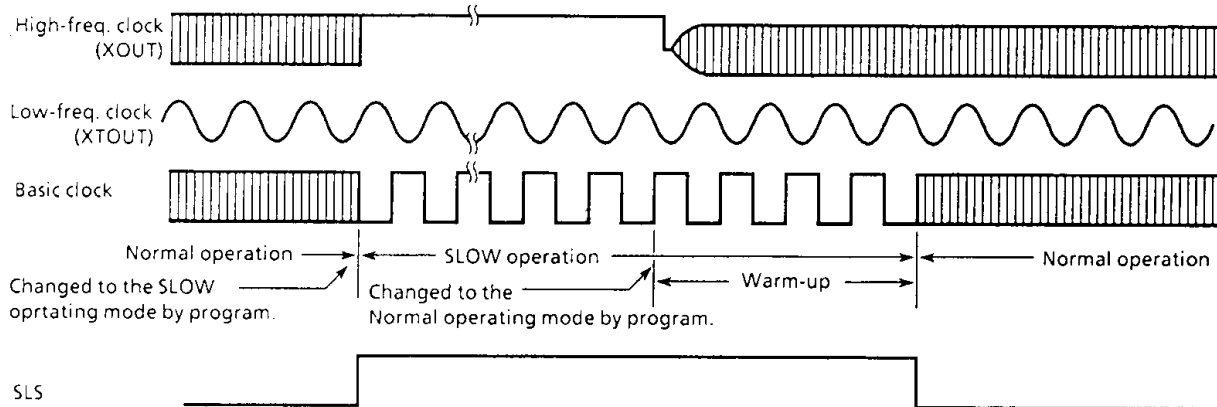

Figure 2-6. System Clock Switching Timing

2.3 Interval Timer

2.3.1 Configuration of Interval Timer

The interval timer is configured with a 15-stage binary counter and inputs the oscillation circuit output (f_s) for the low-frequency clock; therefore, the final stage output is $f_s/2^{15}$ [Hz]. This interval timer is cleared to "0" during reset.

Also, " f_s " is input directly into the interval timer; therefore, the interval timer interrupts, timer/counter and LCD driver will not operate normally if the low-frequency oscillation is not stable.

Figure 2-7. Interval Timer

2.3.2 Interval Timer Interrupt (ITMR)

Constant-frequency interrupts can be generated using the interval timer, Four different frequencies can be selected for interval timer interrupts using the command register (OP19). The command register is also initialized to "0" during reset.

An interval timer interrupt is generated at the first rising edge of the binary counters output after the command is set to the command register.

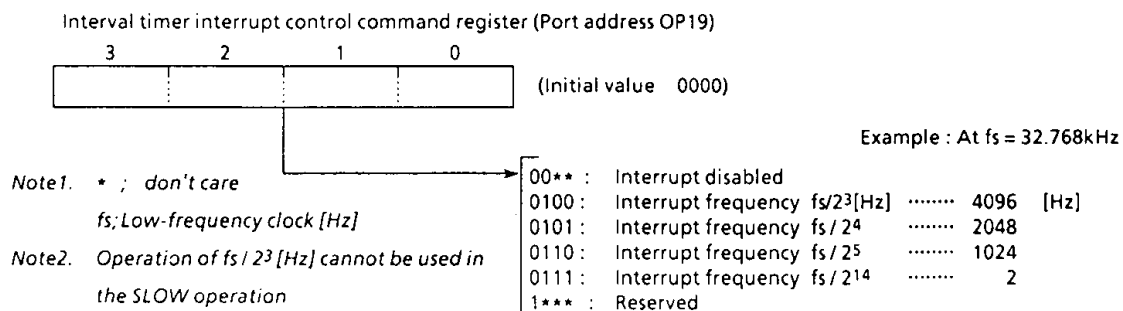

Figure 2-8. Command Register

2.4 Timer/Counter

The timer/counter of the 47C446A is operated by a low-frequency clock (f_s); therefore, the following operating frequencies differ from those of the 47C400A.

- ① Internal pulse rate.
- ② Maximum frequency applied in the event counter mode.
- ③ Drop ratio of instruction execution time when the timer is used.

(1) Internal pulse rate

The internal pulse rates shown in Table 2-2 can be selected by setting the values of the lower 2 bits of the TC1 and TC2 control command registers (OP1C, OP1D).

The values of lower 2 bits (bit1, 0)	Internal pulse rate	Max. setting time	At $f_s = 32.768\text{kHz}$	
			Internal pulse rate	Max. setting time
00	$f_s / 2^3$ [Hz]	$2^{15} / f_s$ [sec]	4096 [Hz]	1 [sec]
01	$f_s / 2^7$	$2^{19} / f_s$	265	16
10	$f_s / 2^{11}$	$2^{23} / f_s$	16	256
11	$f_s / 2^{15}$	$2^{27} / f_s$	1	4096

Table 2-2. Internal Pulse Rate

(2) Maximum frequency applied in the event counter mode.

	Normal operating mode	SLOW operating mode
a. In 1-channel operation -----	$fc / 32$ [Hz]	$fs / 32$ [Hz]
b. In 2-channel operation TC1 -----	$fc / 32$	$fs / 32$
TC2 -----	$fc / 40$	$fs / 40$

(3) Drop ratio of instruction execution time when the timer is used.

With the 47C446A, count operation is inserted in the ratio of once per [(basic clock frequency) / 2³] / (internal pulse rate) instruction cycle; therefore, execution speed drops as follows:

$$100 \div \left\{ \frac{(\text{basic clock frequency}) / 2^3}{(\text{internal pulse rate})} - 1 \right\} \%$$

Example 1: When $fc = 4\text{MHz}$ and $fs = 32.8\text{kHz}$ in the Normal operation and the internal pulse rate $fs/2^3$ is selected, count operation is inserted once per each cycle of 122 instructions; therefore, there is a drop of $100/121 = 0.83\%$ for an instruction execution speed of $2\mu\text{s}$.

Example 2: When $fs = 32.8\text{kHz}$ in the SLOW operation and the internal pulse rate $fs/2^{11}$ is selected, count operation is inserted once per each cycle of 256 instructions; therefore, there is a drop of 0.39% for an instruction execution speed of $244\mu\text{s}$. In addition, when the basic clock is obtained from "fs" (SLOW operation), count operation cannot be used with an internal pulse rate of $fs/2^3$.

2.5 Serial Interface

When operating using the internal clock, $fs/2^2$ [Hz] is used as the serial clock. Consequently, when operating at $fs = 32.768\text{kHz}$, the maximum transfer rate is 8192bps. When the reading and writing of serial data cannot follow this clock rate, the serial clock is automatically stopped and the next shift operation stands by until the processing is completed.

External clock can be used in the same way as for the 47C400A. The serial interface cannot be used in the SLOW operating mode.

2.6 LCD Driver

The 47C446A has the circuit that directly drives the Liquid Crystal Display (LCD) and its control circuit. The 47C446A has the following connecting pins with LCD.

- ① Segment output pins 24 pins (SEG23 - SEG0)
- ② Common output pins 4pins (COM4 - COM1)

In addition, VLC pin is provided as the driver power.

The devices that can be directly driven is selectable from LCD of following drive methods :

- ① 1/4 duty (1/3 bias) LCD Max.96 segments (8 segments x 12 digits)
- ② 1/3 duty (1/3 bias) LCD Max.72 segments (8 segments x 9 digits)
- ③ 1/2 duty (1/2 bias) LCD Max.48 segments (8 segments x 6 digits)
- ④ Static LCD Max.24 segments (8 segments x 3 digits)

2.6.1 Configuration of LCD driver

Figure 2-9 shows the configuration of LCD driver.

Figure 2-9. Configuration of LCD Driver

2.6.2 Control of LCD Driver

The LCD driver is controlled by the command register (OP1B).

Figure 2-10. LCD Driver Control Command Register

(1) Driving methods of LCD

4 kinds of driving methods can be selected by DTY (bits 1 and 0 of command register).

Figure 2-11 shows driving waveforms for LCD.

Note.: f_f ; LCD Frame frequency V_{LCD} ; LCD drive voltage ($=V_{DD}-V_{LC}$)

Figure 2-11. Driving Waveform for LCD (Voltage COM-SEG Pins)

(2) Frame frequency

The frame frequency is set according to the driving method and base frequency as shown in Table 2-3.

The base frequency is given by the Interval Timer.

Base Frequency [Hz]	Driving Method	Frame Frequency [Hz]			
		1/4duty	1/3duty	1/2duty	static
$\frac{f_s}{29}$		$\frac{f_s}{29}$	$\frac{4}{3} \cdot \frac{f_s}{29}$	$\frac{4}{2} \cdot \frac{f_s}{29}$	$\frac{f_s}{29}$
At $f_s = 32.768\text{KHz}$		64	85	128	64

f_s ; Basic clock frequency [Hz]

Table 2-3. Frame Frequency Setting

(3) LCD drive voltage

The LCD drive voltage (V_{LCD}) is given by the difference in potential ($V_{DD}-V_{LC}$) between pins VDD and VLC. Therefore, when the CPU operating voltage and LCD drive voltage are the same, the VLC pin is connected to the VSS pin.

The LCD light only when the difference in potential between the segment output and common output is $\pm V_{LCD}$, and turn off at all other times.

During reset, the power switch of the LCD driver is turned off automatically, shutting off the VLC voltage. Both the segment output and common output become V_{DD} level at this time and the LCD turn off.

The power switch is turned on to supply VLC voltage to the LCD driver by setting EDSP (bits 2 and 3 of the command register) to "11_B". After that, the power switch will not turn off even during blanking (setting EDSP to "01_B") and the VLC voltage continues to flow.

2.6.3 LCD Display Operation

(1) Display data setting

Display data are stored to the display data area (Max. 24 words) in the data memory.

The display data stored to the display data area are read automatically and sent to the LCD driver by the hardware.

The LCD driver generates the segment signals and common signals in accordance with the display data and drive method. Thus, display patterns can be changed by merely overwriting the contents of the display data area with a program. The table look up instruction is mainly used for this overwriting.

Figure 2-12 shows the correspondence between the display data area and the SEG/COM pins. The LCDs light when the display data is "1" and turn off when "0".

The number of segment which can be driven differs depending on the LCD drive method; therefore, the number of display data area bits used to store the data also differs (Refer to Table 2-4). Consequently, data memory not used to store display data and data memory for which the addresses are not connected to LCDs can be used to store ordinary user's processing data.

Driving Method	Bit 3	Bit 2	Bit 1	Bit 0
1/4 duty	COM4	COM3	COM2	COM1
1/3 duty	-	COM3	COM2	COM1
1/2 duty	-	-	COM2	COM1
Static	-	-	-	COM1

Note. - ; This bit is not used for display data.

Figure 2-12. Display Data Area and SEG/COM

Table 2-4. Driving Method and Bit for Display Data

(2) Blanking

Blanking is applied by setting EDSP to "01₈" and turns off the LCD by outputting the non light operation level to the COM pin. The SEG pin continuously outputs the signal level in accordance the display data and drive method.

With static drive, no voltage is applied between the COM and SEG pins when the LCD is turned off by data (display data cleared to "0"), but the COM pin output becomes constant at the V_{LCD}/2 level when turning off the LCD by blanking, so the COM and SEG pins are then driven by V_{LCD}/2.

2.6.4 Control Method of LCD Driver

(1) Initial Setting

Flow chart of initial setting is shown Figure 2-13.

Example : Driving of 1/4duty LCD

```

LD    A, #0000B ; Sets 1/4 duty drive
OUT   A, %OP1B
:
:           ; Initializes display data area
LD    A, #1100B ; Display enable (Release of blanking)
OUT   A, %OP1B
:
:
    
```

Figure 2-13. Initial Setting of LCD Driver

(2) Display data setting

Normally, display data are kept permanently in the program memory and are then stored to the display data area by the table look-up instruction. This can be explained using numerical display with 1/4 duty LCD as an example. The COM and SEG connections to the LCD are the same as those shown in Figure 2-14 and the display, data are as shown in Table 2-5.

Programming example for displaying numerals corresponding to BCD data stored at address 10_H in the data memory is shown below. The display data area is at addresses 20_H and 21_H.

```

Figure 2-16. 1/2 Duty (1/2 Bias) Drive

2.7 A/D Converter

The 47C446A has a 8-bit successive approximate type A/D converter and is capable of processing 4 analog inputs.

2.7.1 Circuit configuration

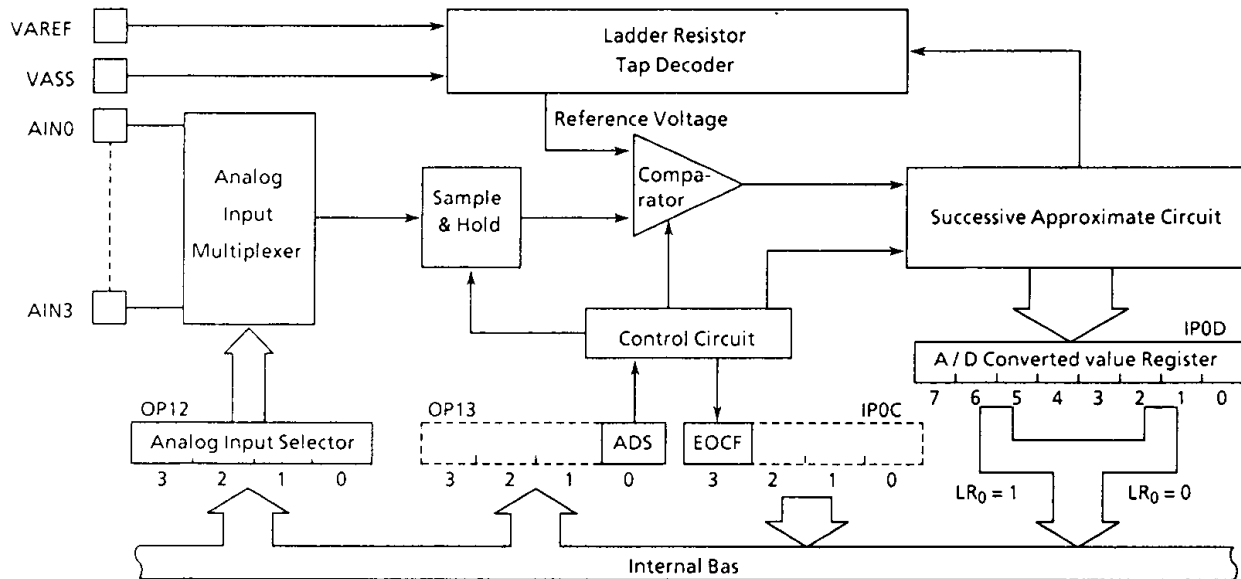

Figure 2-18. Block Diagram of A/D Converter

2.7.2 Control of A/D converter

The operation of A/D converter is controlled by a command. The command register is accessed as port addresses OP12 and OP13. A/D converted value and end of conversion flag (EOCF) can be known by accessing port addresses IP0D and IP0C.

(1) Analog input selector

Analog inputs (AIN0 through AIN7) are selected by values of this register.

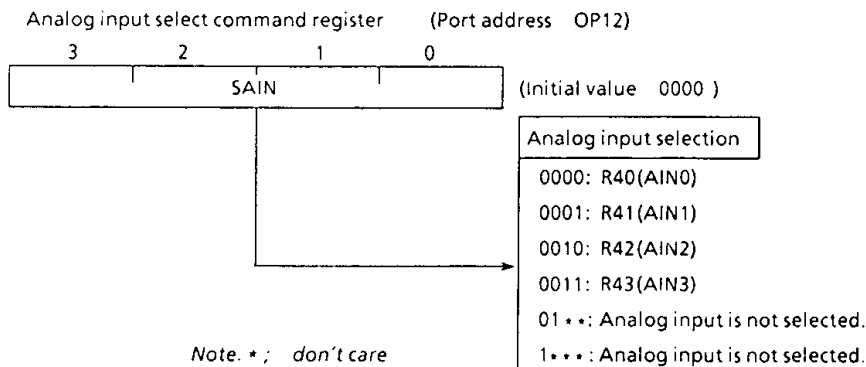

Figure 2-19. Analog input selector

(2) Start of A/D conversion

A/D conversion is started when ADS is set to "1". After the conversion is started, ADS is cleared by hardware. If the restart is requested during the conversion, the conversion is started again at the time.

Figure 2-20. A/D conversion start register

(3) A/D converted value register

An A/D converted value is read by accessing port address IP0D. An A/D converted value is read by splitting into upper 4 bits and lower 4 bits by a value of LR₀ (LSB of the L-registers).

Figure 2-21. A/D converted value register

(4) A/D converter status register

End of conversion flag (EOCF) is a single bit flag showing the end of conversion and is set to "1" when conversion ended. When both upper 4 bits and lower 4 bits of a converted value are read or A/D conversion is started, EOCF is cleared to "0".

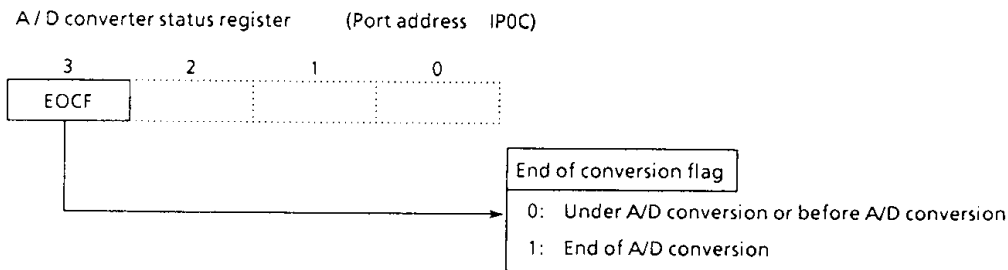

Figure 2-22. A/D converter status register

2.7.3 How to use A/D converter

Apply positive of analog reference voltage to the VAREF pin and negative to the VASS pin. The A/D conversion is carried out by splitting reference voltage between VAREF and VASS to bit corresponding voltage by a ladder resistor and making a judgement by comparing it with analog input voltage.

(1) Start of A / D conversion

Prior to conversion, select one of the analog input AIN0 through AIN3 by the analog input selector. Place output of the analog input, which is to be A/D converted, in the high impedance state by setting "1". If other port is used as an output, be careful not to execute the output instruction for any port during conversion in order to keep accuracy of conversion.

A/D conversion is started by setting ADS (bit 1 of the A/D conversion start register). When conversion ends after 24 instruction cycles, EOCF showing the end of conversion is set to "1".

(2) Reading of an A/D converted value

After the end of conversion, read an A/D converted value is read by splitting into lower 4 bits and upper 4 bits by the A/D converted value register (IP0D).

Lower 4 bits of the A/D converted value can be read when $LR_0 = 0$ and upper 4 bits when $LR_0 = 1$. Usually an A/D converted value is stored in RAM by an instruction [IN %p, @HL]. Further, if an A/D converted value is read during the conversion, it becomes an indefinite value.

Example: Selecting analog input (AIN3), starting A/D conversion, monitoring EOCF and storing lower 4 bits and upper 4 bits of a converted value to RAM [10H] and RAM [11H] respectively.

```

LD      A, #3           ; Selecting analog input (AIN3)
OUT     A, %OP12
LD      A, #1           ; Start of A/D conversion
OUT     A, %OP13
SLOOP : TEST    %IP0C, 3 ; To wait until EOCF goes to "1"
        B       SLOOP
LD      HL, #10H        ; HL ← 10H
IN      %IP0D, @HL      ; RAM [10H] ← Lower 4 bits
INC     L               ; Increment of L registers
IN      %IP0D, @HL      ; RAM [11H] ← Upper 4 bits
    
```

2.8 Watchdog timer (WDT)

The purpose of the watchdog timer is to detect the malfunction (runaway) of program due to external noise or other causes and return the operation to the normal condition. The watchdog timer output is output to R70 (\overline{WTO}) pin.

When the watchdog timer is used, the output latch of R70 must be set to "1". Further, during reset, the output latch of R70 is set to "1", and the watchdog timer becomes disable state.

The initialization at time of runaway will become possible when the \overline{WTO} pin and \overline{RESET} pin are connected each other.

2.8.1 Configuration of Watchdog Timer

The watchdog timer consists of 10-stage binary counter, flip-flop (F/F), and its control circuit. The F/F is set to "1" during reset, and cleared to "0" at the rising edge of the binary counter output.

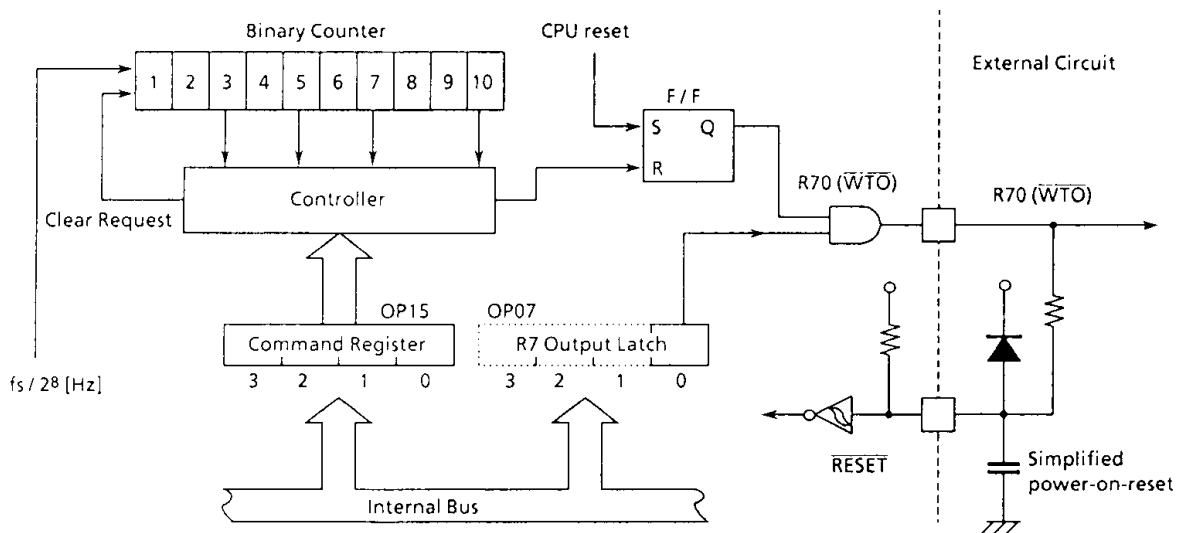

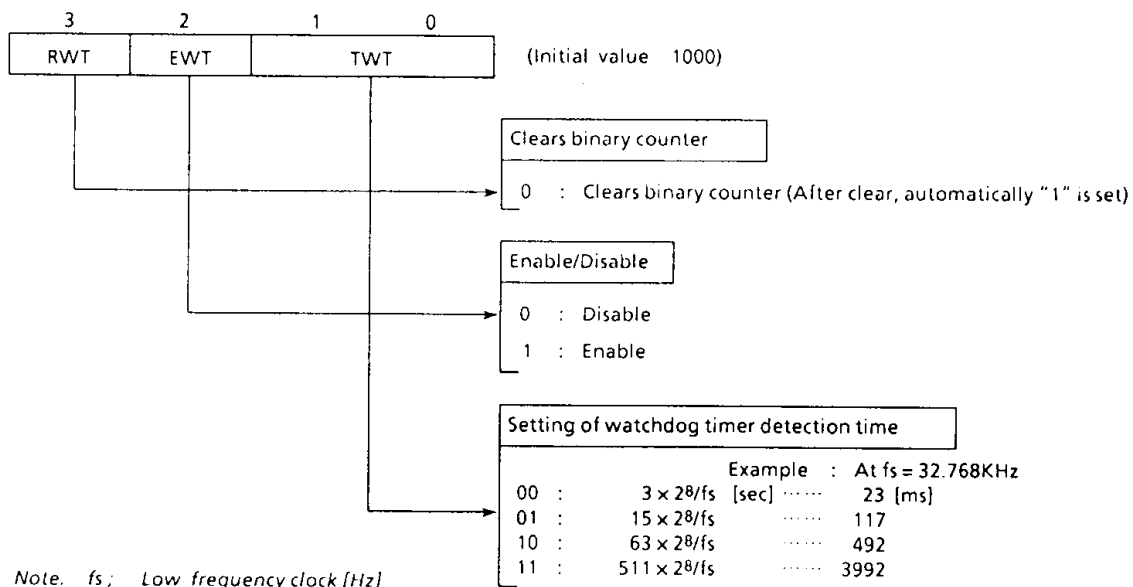

Figure 2-23. Watchdog Timer

2.8.2 Control of watchdog timer

The watchdog timer is controlled by the command register (OP15). This command register is initialized to "1000₂" during reset. The following are procedure to detect the malfunction (runaway) of CPU by the watchdog timer.

- ① At first, detection time of the watchdog timer should be set and binary counter should be cleared.
- ② The watchdog timer should be become enable.
- ③ Binary counter must be cleared before the detection time of the watchdog timer. When the runaway of CPU is taken place for some reason and binary counter is not cleared, the F/F is cleared to "0" at the rising edge of the binary counter and signal of runaway detection is become active (WTO output is "L").

Watchdog Timer control command register (Port address OP15)

Note. fs; Low frequency clock [Hz]

Figure 2-24. Command Register

Example : To set the watchdog detection time ($63 \times 2^8/fs$ [sec]). And to enable the watchdog timer.

```
LD      A, #0010B      ; OP15 ← 00102
                          (Sets WDT detection time. Clears binary counter)
OUT     A, %OP15
LD      A, #1110B      ; OP15 ← 11102 (Enables WDT)
OUT     A, %OP15
Within WDT
detection time
LD      A, #0110B      ; OP15 ← 01102 (Clears binary counter)
OUT     A, %OP15
:
```

Note . It is necessary to clear the binary counter prior to enabling watchdog timer.
Further, when switching the system clock, the watchdog timer has to halt during the warm-up time at changing from the SLOW operating mode to the Normal operating mode.

ELECTRICAL CHARACTERISTICS

ABSOLUTE MAXIMUM RATINGS (V_{SS} = 0V)

PARAMETER	SYMBOL	PINS	RATING	UNIT
Supply Voltage	V _{DD}		- 0.5 to 7	V
Supply Voltage (LCD drive)	V _{LC}		- 0.5 to V _{DD} + 0.5	V
Input Voltage	V _{IN}		- 0.5 to V _{DD} + 0.5	V
Output Voltage	V _{OUT1}	Except sink open drain pin, but include R4	- 0.5 to V _{DD} + 0.5	V
	V _{OUT2}	Ports R5-R9	- 0.5 to 10	
Output Current (per 1 pin)	I _{OUT}		3.2	mA
Power Dissipation [T _{opr} = 70°C]	PD		600	mW
Soldering Temperature (time)	T _{slid}		260 (10sec)	°C
Storage Temperature	T _{stg}		- 55 to 125	°C
Operating Temperature	T _{opr}		- 30 to 70	°C

RECOMMENDED OPERATING CONDITIONS (V_{SS} = 0V, T_{opr} = - 30 to 70°C)

PARAMETER	SYMBOL	PINS	CONDITIONS	Min.	Max.	UNIT
Supply Voltage	V _{DD}		In the Normal mode	4.5	6.0	V
			In the SLOW mode	2.7		
Input High Voltage	V _{IH1}	Except Hysteresis Input	V _{DD} ≥ 4.5V	V _{DD} × 0.7	V _{DD}	V
	V _{IH2}	Hysteresis Input		V _{DD} × 0.75		
	V _{IH3}			V _{DD} < 4.5V		
Input Low Voltage	V _{IL1}	Except Hysteresis Input	V _{DD} ≥ 4.5V	0	V _{DD} × 0.3	V
	V _{IL2}	Hysteresis Input			V _{DD} × 0.25	
	V _{IL3}				V _{DD} < 4.5V	
Clock Frequency (High freq.)	f _c	XIN, XOUT		0.4	4.2	MHz
Clock Frequency (Low freq.)	f _s	XTIN, XTOUT		30.0	34.0	KHz

Note 1. Input Voltage V_{IH3}, V_{IL3} : in the SLOW mode

D.C. CHARACTERISTICS

(V_{SS} = 0V, T_{opr} = -30 to 70°C)

PARAMETER	SYMBOL	PINS	CONDITIONS	Min.	Typ.	Max.	UNIT
Hysteresis Voltage	V _{HS}	Hysteresis Input		—	0.7	—	V
Input Current	I _{IN1}	Port K0, TEST RESET	V _{DD} = 5.5V,	—	—	± 2	μA
	I _{IN2}	Ports R (open drain)	V _{IN} = 5.5V / 0V				
Low Level Input Current	I _{IL}	Ports R (push-pull)	V _{DD} = 5.5V, V _{IN} = 0.4V	—	—	- 2	mA
Input Resistance	R _{IN1}	Port K0 with pull-up/pull-down		30	70	150	KΩ
	R _{IN2}	RESET		100	220	450	
Output Leakage Current	I _{LO}	Ports R (open drain)	V _{DD} = 5.5V, V _{OUT} = 5.5V	—	—	2	μA
Output High Voltage	V _{OH}	Ports R (push-pull)	V _{DD} = 4.5V, I _{OH} = -200μA	2.4	—	—	V
Output Low Voltage	V _{OL2}	Except XOUT	V _{DD} = 4.5V, I _{OL} = 1.6mA	—	—	0.4	V
Segment Output Resistance	R _{OS}	SEG pin	V _{DD} = 5V, V _{DD} - V _{LC} = 3V	—	20	—	KΩ
Common Output Resistance	R _{OC}	COM pin					
Segment/Common Output Voltage	V _{O2/3}	SEG / COM pin		3.8	4.0	4.2	
	V _{O1/2}		3.3	3.5	3.7		
	V _{O1/3}		2.8	3.0	3.2		
Supply Current (in the Nomal mode)	I _{DD}		V _{DD} = 5.5V, V _{LC} = V _{SS} f _c = 4MHz	—	3	6	mA
Supply Current (in the SLOW mode)	I _{DD5}		V _{DD} = 3V, V _{LC} = V _{SS} f _s = 32.768KHz	—	15	30	μA

Note 1. Typ. values shows those at T_{opr} = 25°C, V_{DD} = 5V.

Note 2. Input Current I_{IN1}: The current through resistor is not included, when the input resistor (pull-up/pull-down) is contained.

Note 3. Output Resistance R_{OS}, R_{OC}: Shows on-resistance at the level switching.

Note 4. V_{O2/3}: Shows 2/3 level output voltage, when the 1/4 or 1/3 duty LCD is used.

V_{O1/2}: Shows 1/2 level output voltage, when the 1/2 duty or static LCD is used.

V_{O1/3}: Shows 1/3 level output voltage, when the 1/4 or 1/3 duty LCD is used.

Note 5. Supply Current I_{DD}: V_{IN} = 5.3V/0.2V

The Port K0 is open when the input resistor is contained.

The voltage applied to the Port R is within the valid range.

Note 6. Supply Current I_{DD5}: V_{IN} = 2.8V/0.2V. Only low frequency clock is only osillated (connecting XTIN, XTOUT).

A / D CONVERSION CHARACTERISTICS

($T_{opr} = -30$ to 70°C)

PARAMETER	SYMBOL	CONDITIONS	Min.	Typ.	Max.	UNIT
Analog Reference Voltage	V_{AREF}		$V_{DD} - 1.5$	—	V_{DD}	V
	V_{ASS}		V_{SS}	—	1.5

A/D Sampling Time	t_{AIN}	$f_c = 4\text{MHz}$	—	4	—	μs
Shift data Hold Time	t_{SDH}		$0.5t_{cy} - 300$	—	—	ns

Note. Shift data Hold Time

External circuit for $\overline{\text{SCK}}$ pin and SO pin

RECOMMENDED OSCILLATING CONDITIONS

($V_{SS} = 0V$, $V_{DD} = 4.5$ to $6.0V$, $T_{opr} = -30$ to $70^{\circ}C$)

(1) 4MHz

Ceramic Resonator

CSA4.00MG (MURATA)

$C_{XIN} = C_{XOUT} = 30pF$

KBR-4.00MS (KYOCERA)

$C_{XIN} = C_{XOUT} = 30pF$

Crystal Oscillator

204B-6F 4.0000 (TOYOCOM)

$C_{XIN} = C_{XOUT} = 20pF$

(2) 400KHz

Ceramic Resonator

CSB400B (MURATA)

$C_{XIN} = C_{XOUT} = 220pF$, $R_{XOUT} = 6.8K\Omega$

KBR-400B (KYOCERA)

$C_{XIN} = C_{XOUT} = 100pF$, $R_{XOUT} = 10K\Omega$

TYPICAL CHARACTERISTICS

INPUT/OUTPUT CIRCUITRY

(1) Control pins

Input/Output circuitries of the 47C446A control pins are shown below.

CONTROL PIN	I/O	CIRCUITRY	REMARKS
XIN XOUT	INPUT OUTPUT		Resonator connecting pins (High frequency) $R = 1K\Omega$ (typ.) $R_f = 1.5M\Omega$ (typ.) $R_O = 2K\Omega$ (typ.)
XTIN XTOUT	INPUT OUTPUT		Resonator connecting pins (Low frequency) $R = 1K\Omega$ (typ.) $R_f = 15M\Omega$ (typ.) $R_O = 200K\Omega$ (typ.)
$\overline{\text{RESET}}$	INPUT		Hysteresis input Pull-up resistor $R_{IN} = 220K\Omega$ (typ.) $R = 1K\Omega$ (typ.)
TEST	INPUT		Contained pull-down resistor $R_{IN} = 70K\Omega$ (typ.) $R = 1K\Omega$ (typ.)

(2) I/O Ports

The input/output circuitries of the 47C446A I/O ports are shown as below, any one of the circuitries can be chosen by a code (SA-SF) as a mask option.

PORT	I/O	INPUT/OUTPUT CIRCUITRY and CODE			REMARKS
		SA, SD	SB, SE	SC, SF	
K0	Input				Pull-up / pull-down resistor $R_{IN} = 70K\Omega$ (typ.) $R = 1K\Omega$ (typ.)
R4	I/O				Sink open drain output Initial "Hi-Z" $R = 1K\Omega$ (typ.) Analog input $R_A = 5K\Omega$ (typ.) $C_A = 12pF$ (typ.)
R5 R6	I/O	SA, SB, SC Initial "Hi-Z" 	SD, SE, SF Initial "High" 	Sink open drain output or push-pull output $R = 1K\Omega$ (typ.)	
R7	I/O				Sink open drain output Initial "Hi-Z" $R = 1K\Omega$ (typ.)
R8 R9	I/O				Sink open drain output Initial "Hi-Z" Hysteresis input $R = 1K\Omega$ (typ.)

CMOS 4-BIT MICROCONTROLLER

TMP47C946AG

The 47C946A, which is equipped with an EPROM as program memory, is a piggyback type evaluator chip used for development and operational confirmation of the 47C446A application systems (programs). The 47C946A is pin compatible with the 47C446A which are mask-programed ROM devices.

PIN ASSIGNMENT (TOP VIEW)

PIN FUNCTION (Top of the package)

PIN NAME	Input / Output	FUNCTIONS
A11 ~ A0	Output	Program memory address output
I7 ~ I0	Input	Program memory data input
\overline{CE}	Output	Chip enable signal output
\overline{OE}		Output enable signal output
VCC	Power supply	+ 5V (connected with VDD)
GND		0V (connected with VSS)

NOTES FOR USE

(1) Program memory

The program area is as shown in Figure 1.

Figure 1. Program area

(2) I/O ports

Input/Output circuitries of I/O ports in the 47C946A are similar to the code 5A of the 47C446A. When this chip is used as evaluator with other I/O code, it is necessary to provide the external resistors.

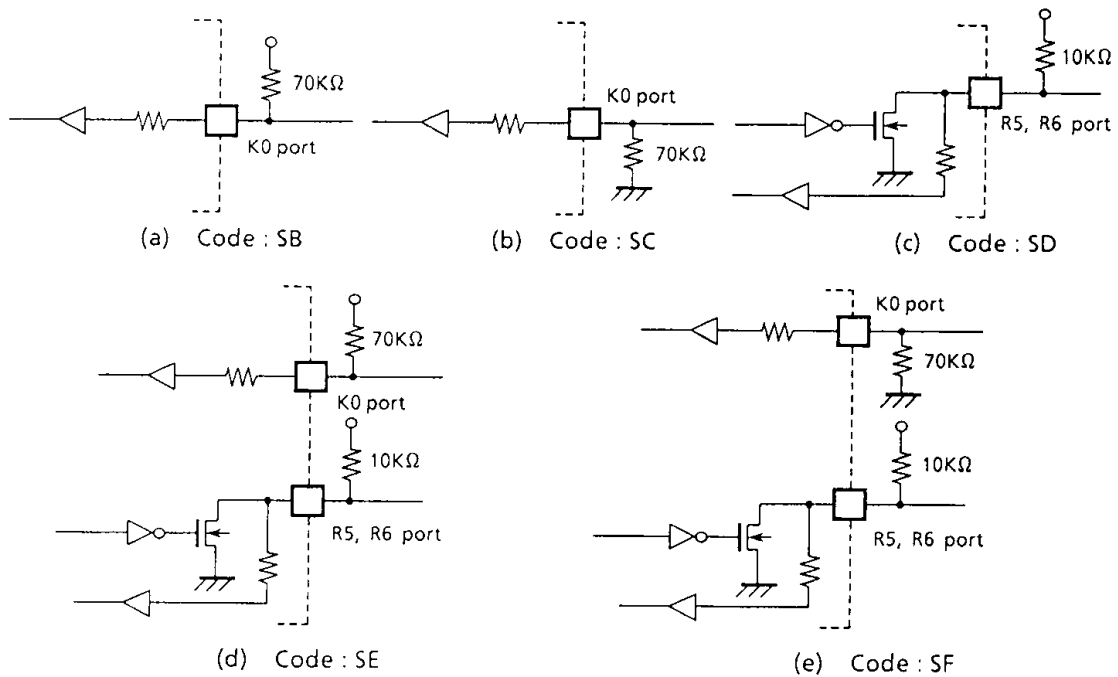

Figure 2. I/O code and external circuitry
