FUNCTIONAL DESCRIPTION

(1) Timing of DATA, CK, ST

The Serial Input Data is input to internal shift register sequentially synchronized by clock signal rising edge input from CK terminal (100 kHz max.).

The Serial Input Data in the shift register is transferred to latch circuit and renew by synchronized rising edge of Chip enable signal input from ST terminal.

(Detailed Timing)

(2) Data Format

The 14-bit serial data strings format from MSB to LSB are 8-bit analog switch control data, 2-bit right and left channel selection data and 4-bit address data.

(Switch)

Bit1 ~ bit8 select the analog switch ON and OFF 0: switch off
 1: switch on

(Channel)

Bit9 and 10 select the channel.

bit9	bit10	CHANNEL
1	1	L and R
1	0	R only
0	1	L only

(Address)

Bit11 to 14 select the address. This address select is used for chip selection when this LSI is connected to the common bus line.

(3) Supply Voltage

The power supply of NJU7313A is divided into two portions of analog switch part and control part. The analog switch part operate by dual power supply (+ and -) and control part is operate by single power supply (+) only.

The analog switch part can be also operated by single power supply. In this case, the supply voltage should be half of dual supply operation mode.

Furthermore, the CK, DATA and ST terminals realize direct interface with 5V operated family because of its input threshold level is adjusted.
