**DESCRIPTION**

The L4953 contains a triple voltage regulator and a power switch.

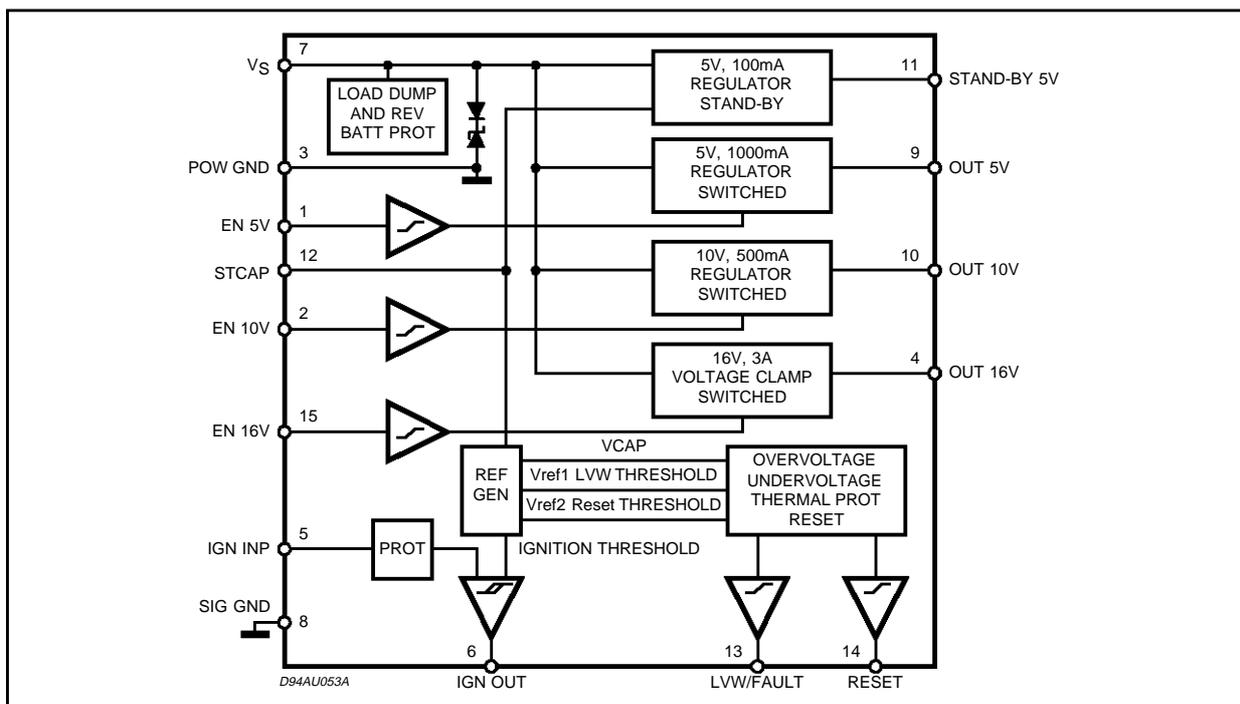

The IC includes a monitoring circuit to warn if a

low voltage or no voltage condition is occurring.

In stand-by output is active as long as possible even when in thermal shutdown or any other fault conditions.

The STCAP pin allows the use of a reserve supply capacitor that will hold enough energy for the 5V Stand-by line to allow the  $\mu$ P to store data.
