1. Short Descriptions

The ATJ2073 is a single-chip highly-integrated digital music system solution for devices such as dedicated audio players, PDAs, and cell phones. It includes an audio decoder with a high performance DSP with embedded RAM, ADPCM/AG record capabilities and USB interface for downloading music and uploading voice recordings. ATJ2073 also provides an interface to S/PDIF audio data input, flash memory, LED/LCD, button and switch inputs, headphone, and microphone, and FM radio control. The ATJ2073's programmable architecture supports the MP3 and other digital audio standards. For devices like USB Flash Disk, the ATJ2073 can act as a USB mass storage slave device to personal computer system. The ATJ2073 has low power consumption to allow long battery life and an efficient flexible on-chip DC-DC converter that allows many different battery configurations, including 1xAA, 1xAAA, 2xAA,2xAAA.

2. Features

- 24-bit DSP Core with on-chip ICE support
- On-chip DSP 16Kx24 PM and (16K-256)x24 DM, can be switched to be MCU memory space
- Integrated 8bit MCU with on-chip ICE support which the instructions are compatible with the Z80 CPU
- Internal 16k bytes SRAM accessed by MCU
- External up to 25-bit code address space with 7 chips select
- Support 14.318MHz/16.368MHz/17.734475MHz/24.576MHz OSC with on-chip PLL for DSP
- Supported up to 3*4Gbyte Nand type Flash
- 2-channel DMA for MCU
- 1-channel CTC(Counter/Timer Controller) for MCU
- On-chip interrupt controller for MCU
- Built-in power management unit(PMU), supporting 1 or 2 batteries operation
- Support RTC with 32.768kHz or 76.8kHz OSC
- Built-in USB1.1 interface
- Support SPDIF IN/UART/IR interface
- Support on-chip Stereo 18 bit Sigma-Delta DAC
- Support external 6800 or 8086 series interface LCM
- Support 4x13 matrix Keyboard Circuit Auto Scan
- Support 20 General Purpose Input/Output
- Support external Epson Series LCM Frame Buffer up to 320x240 dots
- Support on-chip 1/3 biased 1/4 duty LCD driver(4x13dots, multiplexed)
- Support external CMOS image sensor interface
- On-chip 16-bit ADC for Microphone input support , sample rate at 8K/11K/12K/16K/22K/24KHz
- On-chip 2 channel headphone power amplifiers
- 128-pin 14x14x1.4mm LQFP package

5. Functional Description

5.1 DSP Core

24-bit Harvard architecture DSP with on-chip ICE support is built in. it works with a memory word length of 24 bits. ATJ2073 has 16KB*24bit Program Memory (PM) and (16KB-256)*24bit Data Memory (DM). Memory-Mapped Register include DAC interface. Process capability is controlled by software Up to 48 MIPS.

5.2 MCU Core

Integrated 8-bit MCU with on-chip ICE support. Instruction set is compatible with Z80. Process capability is controlled by software Up to 24.576 MHz.

5.3 System Memory Mapping

Assuming MCU instruction uses A[15:0] to access memory space.

If A[15]=0 -> mapped to internal SRAM ,then

If A[14]=0, mapped to lower 16KB (ZRAM)

If A[14]=1, mapped to upper 16KB (IPMH/IPMM/IPML/IDMH/IDMM/IDML/VRAM) when they are mapped into MCU memory space. Additional three extended bits of SRAM Page Register (IO index=0x05) are used to decode which page to access.

Bit 2 1 0	Accessed Page
0 0 0	16K of IPM low byte
0 0 1	16K of IPM middle byte
0 1 0	16K of IPM high byte
0 1 1	reserved
1 0 0	16K of IDM low byte
1 0 1	16K of IDM middle byte
1 1 0	16K of IDM high byte
1 1 1	on-chip VRAM (Video RAM)

IPM/IDM can map to MCU memory space in 8K unit.

If A[15]=1 -> External address pin A25~A15 are IO mapped at 01h and 02h for EMA15-25. While EMA26-28 are used to decode CE0- ~ CE6-.

CE0- is used to access boot code from ROM/MASK/NOR-type Flash

CE1- to CE6- can be configured to access ROM, or RAM or NAND-type Flash

5.4 USB1.1 Interface

Compliant with USB SPEC 1.1. Certified by USB IF.

4 endpoints are provided. Support bulk, control, interrupt and isochronous transfer mode . Endpoint 1 and endpoint 2 employ two independent FIFOs for bulk or isochronous transfers. Endpoint 0 and endpoint 3 have 8 bytes maximum packet size. There are 4 interrupt requests for each endpoint respectively. Generally, this setting should be satisfying for most practical needs.

5.5 MPEG Decoder

With system software, ATJ2073 is competent for MPEG 1/2/2.5 Layer I/II/III decode.

Sample rates (SR) and bit rates (BR) supported is shown as the following table.

5.6 Microphone Interface

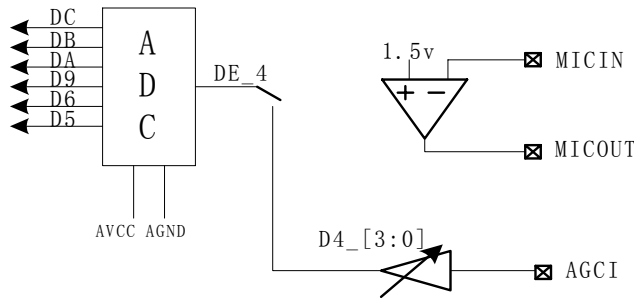

Microphone interface is composed of microphone pre-amplifier and 16-bit ADC.

Microphone pre-amplifier has 35db gain at least for suitable recording volume so the noise of microphone power supply must be very low. It is composed of a regulator and an external first order RC LPF. AGC function is implemented by a variable gain amplifier and 4 register bits (MCU code control).

The ADC adopts switched-capacitor successive approximation method. Its input is from microphone pre-amplifier's output. Function enable, sampling frequency select, and some other control signals are all from

one register.

5.7 SPDIF Interface

The AES/EBU interface is a means for serially communicating digital audio data through one single transmission line. It provides two channels for audio data, a method for communicating control information, and has error detection capabilities. The control information is transmitted as one bit per sample and accumulates in a block structure. The data is bi-phase encoded, which enables the receiver to extract a clock from the data . Coding violations, defined as preambles, are used to identify sample and block boundaries.

2 8-level by 8-bit FIFO are used to buffer data for TX and RX. After received 192 frame- four bytes of channel status was appended into the RX FIFO. When TX FIFO is empty and SPDIF is enabled, 0 is send out for all frame.

5.8 Power Management Unit (PMU)

PMU consists of DC-DC converter and regulator and battery monitor.

ATJ2073 need two power trails if work rightly, VDD (Core Power) and VCC (I/O Power). The power level is decided by external voltage-divided resistance network . Due to describe clearly , we assume VDD=2.35V, VCC=3.15V.

There are two battery modes with ATJ2073, one-battery mode and two-battery mode, selected by BATSEL. In one-battery mode, if pin VBAT > 0.8V, some internal circuit (C1) begin to work first and it will rise up VDD. When VDD reaches 2.35V, that internal circuit (C1) stops and another circuit (C2) takes over the PFM for both VDD and VCC DC-DC converter.

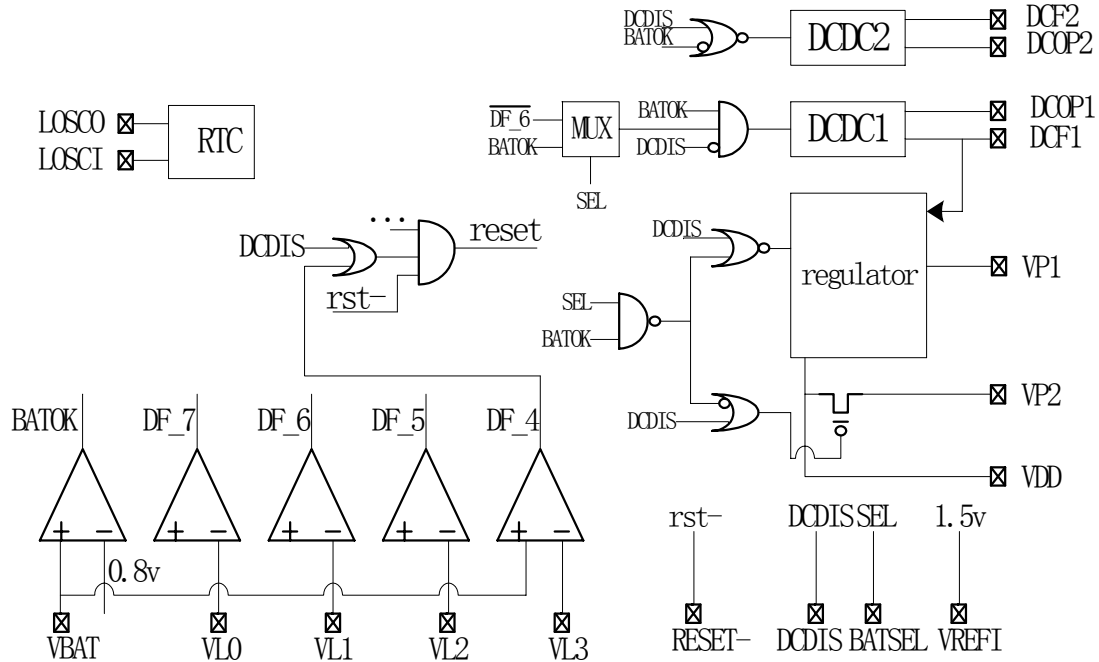

In two-battery mode, if pin VBAT > 1.3V, the internal regulator is enabled to supply VDD. If 0.8V < VBAT < 1.3V, C2 will stimulate VDD DC-DC converter to maintain VDD. The judgement between VBAT and 1.3V must have hysteresis for preventing ATJ2073 from unstable toggle between regulator mode and DC-DC mode. The VCC DC-DC converter always runs to maintain VCC.

Battery monitor compares the battery voltage at the VBAT pin with four reference voltage pins named VL0, VL1, VL2, VL3. The four reference voltages are decided by external resistance network. For normal dry battery (1.5V) , the value can be : 1.4V, 1.3V, 1.15V, and 1.05V.

If VBAT < VL3, ATJ2073 will go into STANDBY mode;

If VBAT < 0.8V, ATJ2073 will go into OFF mode, but the low frequency OSC and RTC timer are still active.

You can disable the clock of block when you do not use that block. Even more you can stop all the clock, but low frequency OSC, while you design appropriately.

6. Control Interfaces

6.1 How System Power Up

When pin VBAT get to about 0.8V level , DC-DC converter. will begin to rise up VDD and VCC. Low frequency oscillator will begin to work too. After a duration , POR(Power On Reset) will deassert . ATJ2073 finishes Power Up sequence . If pin RESET- is not assert, MCU will run from address=0x8000. Boot code at address=0x8000 will be as the following:

```

JP 8003h
LD A, 01h
OUT (04h), A
JP Start
... ..

```

Start:

6.2 Key Matrix Scan

When key scan circuit is enabled, ATJ2073 will scan the keyboard periodically. It drives pin KEYOUTn [n=0...7] low pulse in turn . When a key is pressed, pin KEYINn connecting the key will be found low level.

There are 12 internal 8-bit registers for key value latch per scan. But only another one register (Key Scan Data Register) for MCU to access key value . Those 12 internal registers are mapped into this register, and an internal pointer is used to point to the current register to return scan data when read. Any IO write to this register will clear the internal register, and the pointer will increase by 1 and point to the next register after read is performed.

6.3 4*13 LCD Driver

ATJ2073 builds in 1/3 biased 1/4 duty LCD driver. It outputs COM and SEG signals to LCD glass directly. Bias voltage pin V1 and V2 need connect by-pass capacitor to ground. V0=GND, V3=VCC.

6.4 8080/6800 LCM Interface

ATJ2073 supports high-speed 8-bit parallel bi-directional LCM with 6800-series or 8080-series interface.

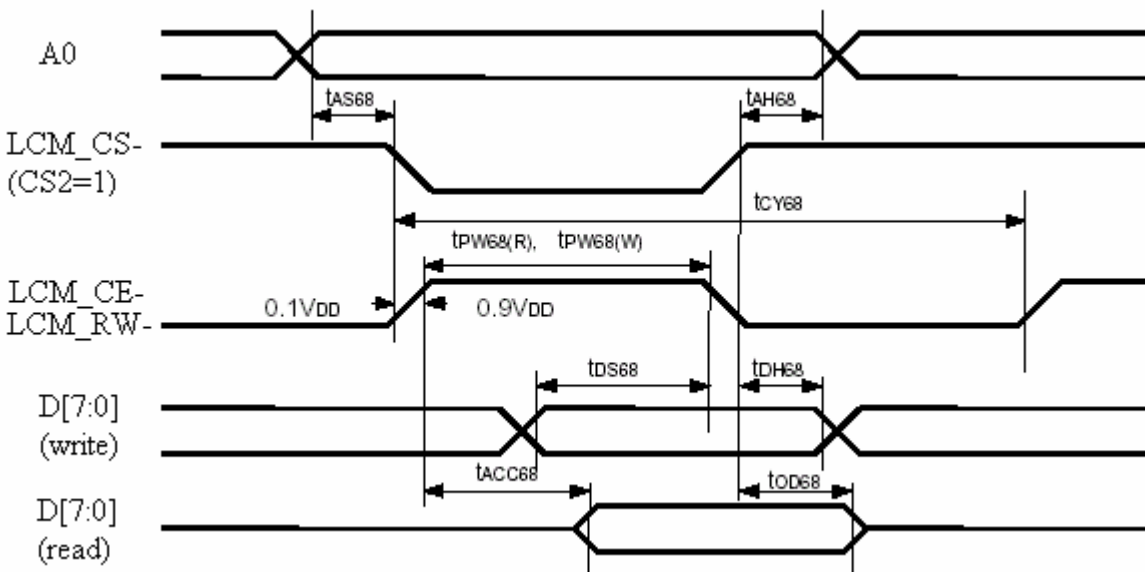

1. LCM with 8080-series interface:

Use A0 to select Data register or Command register in LCM.
CEx- is used as chip select. Pin CS2 of LCM is pull high to VCC.
MWR- is write enable signal, ATJ2073 latches D[7:0] at the rising edge.
MRD- is read enable signal and LCM drives D[7:0] when MRD- is low.

2. LCM with 6800-series interface:

Use A0 to select Data register or Command register in LCM.
LCM_CS- is used as chip select. Pin CS2 of LCM is pull high to VCC.
LCM_RW- is read/write indication signal and high indicates read operation.
LCM_CE- is latch signal. It should latch D[7:0] at the falling edge.

7. Pin Configurations

ATJ2073 has many Multiple Function Pins (MFP), these pins are multiplexed by several functions.

Pin name will indicate the default function. Other functions can be enabled by system I/O register.

Cautions

1. Do not short-circuit two or more output pins simultaneously.
2. If even one of the above parameters exceeds the absolute maximum ratings even momentarily, the quality of the product may be degraded. The absolute maximum ratings, therefore, specify the value exceeding which the product may be physically damaged. Use the product well within these ratings.

The specifications and conditions shown in DC Characteristics and AC characteristics are the ranges for normal operation and quality assurance of the product.

High-level output voltage	VOH	IOH = -2 mA	2.4	—	—	V
Low-level output voltage	VOL	IOL = 2 mA	—	—	0.4	V
High-level input voltage	VIH		0.6* VCC	—	VCC + 0.6	V
Low-level input voltage	VIL		-0.3	—	0.4V CC	V
Input leakage current	ILI	VCC = 3.6 V, VI = VCC, 0 V	—	—	±10	uA
Output leakage current	ILO	VCC = 3.6 V, VI = VCC, 0 V	—	—	±5	uA
GPIO	Idrive1	Gpioc1,Gpioc3,Gpioc5	—	2.60	—	mA

Drive	Idrive2	Other Gpio	—	1.25	—	mA
Supply Current (Two batteries mode)	Ivdd	In Fullspeed mode (MCU run 24.576MHz in internal SRAM,DSP run 24MIPS)	—	40	—	mA
		In Standby mode	—	100	—	uA
	Ivcc	In Fullspeed mode (MCU run 24.576MHz in internal SRAM,DSP run 24MIPS)	—	16	—	mA
		In Standby mode	—	18	—	uA

Notes 1. IvDD is a total core power supply current for the VDD power supply. IvDD is applied to the LOGIC and PLL and OSC block.

Ivcc is a total I/O power supply current for the 3.3 V power supply. Ivcc is applied to the USB, IO, TP, and AD block.

8.4 AC Characteristics (TA = 25°C, VDD = 2 to 2.7 V, VCC = 2.7 to 3.6 V)

(3) GPIO interface parameter

Parameter	Symbol	Condition	MIN.	MAX.	Unit
Input level width	t _{GPIN}	Normal operation	11/ f _{MCUclk}		□ s
GPIO input rise time	t _{GPRISE}			200	ns
GPIO input fall time	t _{GPFALL}			200	ns
Output level width	t _{GPOUT}		11/ f _{MCUclk}		ns

Notes 1. f_{MCUclk} is the frequency that MCU is running upon.

(a) Input level width

(b) Input rise/fall time

(c) Output level width

(4) Ordinary ROM parameter

Parameter	Symbol	Condition	MIN.	MAX.	Unit
Data access time (from address) ^{Note}	t _{ACC}	HOSC=24.576MHz Z	102		ns
Data access time (from CEx# □) ^{Note}	t _{CE}	HOSC=24.576MHz Z	82		ns
Data input setup time	t _{DS}	HOSC=24.576MHz Z	0		ns
Data input hold time	t _{DH}	HOSC=24.576MHz Z	0		ns

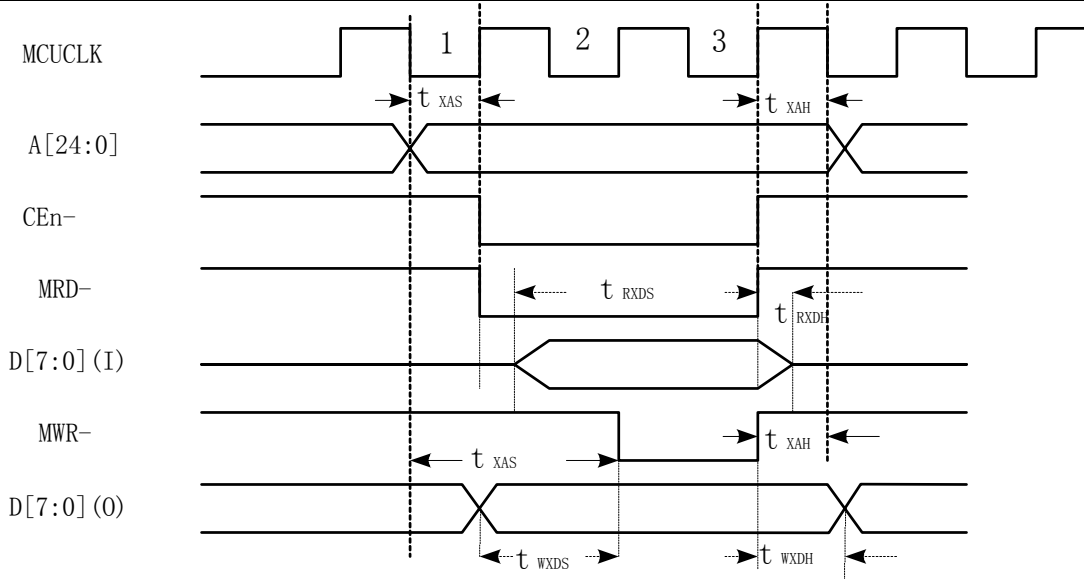

(5) External system bus parameter

Parameter	Symbol	Condition	MIN.	MAX.	Unit
Address setup time (to command signal □) ^{Note 1, 2}	t _{XAS}	Memory Read	0.5T		ns
	t _{XAS}	Memory Write	1.5T		ns
Address hold time (from command signal □) ^{Note 1, 2}	t _{XAH}		0.5T		ns
Data output setup time (to command signal □) ^{Note 1}	t _{WXDS}		0	T	ns
Data output hold time (from command signal □) ^{Note 1}	t _{WXDH}		3	0.5T	ns
Data input setup time (to command signal □) ^{Note 1}	t _{RXDS}		0	2T	ns
Data input hold time (from command signal □) ^{Note 1}	t _{RXDH}		0		ns

Notes 1. MRD#, MWR# are called the command signals for the External System Bus Interface.

2. T (ns) = 1000 / fMCUCLK

Bus Operation

(a) Instruction fetch cycle

(b) Memory read cycle

(c) Memory write cycle

(6) Keyboard interface parameter

Parameter	Symbol	Condition	MIN.	MAX.	Unit
KEYOUT (7:0) low-level width	tSCAN	Debounce time=2.5ms	130		μs
Voltage stabilization time (KEYOUT n □ □ KEYOUT (n+1) □)	tKWAIT	Debounce time=2.5ms	0		μs
Key scan interval time	tKI	Debounce time=2.5ms	130		μs
Key input delay time (from KEYOUT n □)	tKS	Debounce time=2.5ms	0		μs
Key input hold time (from KEYOUT n □)	tKH	Debounce time=2.5ms	0		μs

Remarks

- KEYOUT(7:0) is multiplexed with GIOF(7:0); KEYIN(3:0) is multiplexed with GIOD(7:4); KEYIN(11:4) is multiplexed with GIOE(7:0)
- Keyscan Debouncing time is set thru Bit(2:0) of the MFP Configuration1 Register[0xB1h]
- n = 0 to 7

NOTE :

- △ TO BE DETERMINED AT SEATING PLANE \square .
- △ DIMENSIONS D₁ AND E₁ DO NOT INCLUDE MOLD PROTRUSION. D₁ AND E₁ ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH.
- △ DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. DAMBAR CAN NOT BE LOCATED ON THE LOWER RADII OF THE FOOT.
- △ EXACT SHAPE OF EACH CORNER IS OPTIONAL.
- △ THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 mm AND 0.25 mm FROM THE LEAD TIP.
- △ A₁ IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.
- 7. CONTROLLING DIMENSION : MILLIMETER.
