Attention please!

As far as patents or other rights of third parties are concerned, liability is only assumed for components, not for applications, processes and circuits implemented within components or assemblies.

The information describes the type of component and shall not be considered as assured characteristics.

Terms of delivery and rights to change design reserved.

For questions on technology, delivery and prices please contact the Semiconductor Group Offices in Germany or the Siemens Companies and Representatives worldwide (see address list).

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Siemens Office, Semiconductor Group.

Siemens AG is an approved CECC manufacturer.

Packing

Please use the recycling operators known to you. We can also help you – get in touch with your nearest sales office. By agreement we will take packing material back, if it is sorted. You must bear the costs of transport.

For packing material that is returned to us unsorted or which we are not obliged to accept, we shall have to invoice you for any costs incurred.

Components used in life-support devices or systems must be expressly authorized for such purpose!

Critical components¹ of the Semiconductor Group of Siemens AG, may only be used in life-support devices or systems² with the express written approval of the Semiconductor Group of Siemens AG.

- 1 A critical component is a component used in a life-support device or system whose failure can reasonably be expected to cause the failure of that life-support device or system, or to affect its safety or effectiveness of that device or system.
- 2 Life support devices or systems are intended (a) to be implanted in the human body, or (b) to support and/or maintain and sustain human life. If they fail, it is reasonable to assume that the health of the user may be endangered.

1 Introduction

The Field Mixer SDA 9270 is an add-on component for the Siemens MEGAVISION IC set which enables the system to reduce large area *and* line flickering of interlaced TV standards.

1.1 Features

- High performance line flicker reduction algorithm
- Two input data formats (4:1:1 and 4:2:2)
- I²C-Bus control
- P-MQFP-80 package
- 5 V supply voltage

Supported MEGAVISION features

- Multipicture (still in picture, picture in still, 9xpicture)
- Still field
- Zoom

New MEGAVISION features

- Still frame
- Background still field

MEGAVISION features not supported

- 4:4:4
- Colored frame insertion (FRM)

Type	Ordering Code	Package

Pin Description (cont'd)

Pin No.	Name	Type	Description
68	BLN3	Q/TTL	Blanking signal / BLN2 delayed
69	VS3	Q/TTL	Vertical synchronization signal (switched raster)
72	RENA	Q/TTL	RAM enable field memory A
73	OEBA	Q/TTL	Output enable port B of field memory A

S: supply, I: input, Q: output, TTL: digital (TTL)

2 System Description

The device generates at its output an opportune sequence of 100/120 Hz fields derived by processing the field A and the field B which are stored in 2 external field memories and made available to the SDA 9270 on 2 separate input ports of 16 bit width each.

The device SDA 9270 generates also control signals for the SDA 9251 which are necessary to operate the TV - SAMs in the Frame mode, that is to write the incoming information alternatively in one or the other field memory.

Additionally the device generates a vertical sync pulse which has to be synchronized with the respective field output. A horizontal blanking signal in phase with the output data is also made available.

2.1 Input Data Format

The SDA 9270 accepts for the input channels A and B two different input formats (I²C-Bus : INFOR) with two possible sample frequency relations of Y : (B-Y) : (R-Y). The representation of the samples is programmable separately for luminance and chrominance signals as positive dual code or 2's complement code (I²C-Bus : INCODL, INCODC)

Data Pin	Data Format 4:1:1 INFOR = 0				4:2:2 Parallel INFOR = 1	
	Y ₀₇	Y ₁₇	Y ₂₇	Y ₃₇	Y ₀₇	Y ₁₇
Yx7	Y ₀₇	Y ₁₇	Y ₂₇	Y ₃₇	Y ₀₇	Y ₁₇
Yx6	Y ₀₆	Y ₁₆	Y ₂₆	Y ₃₆	Y ₀₆	Y ₁₆
Yx5	Y ₀₅	Y ₁₅	Y ₂₅	Y ₃₅	Y ₀₅	Y ₁₅
Yx4	Y ₀₄	Y ₁₄	Y ₂₄	Y ₃₄	Y ₀₄	Y ₁₄
Yx3	Y ₀₃	Y ₁₃	Y ₂₃	Y ₃₃	Y ₀₃	Y ₁₃
Yx2	Y ₀₂	Y ₁₂	Y ₂₂	Y ₃₂	Y ₀₂	Y ₁₂
Yx1	Y ₀₁	Y ₁₁	Y ₂₁	Y ₃₁	Y ₀₁	Y ₁₁
Yx0	Y ₀₀	Y ₁₀	Y ₂₀	Y ₃₀	Y ₀₀	Y ₁₀
UVx7	U ₀₇	U ₀₅	U ₀₃	U ₀₁	U ₀₇	V ₀₇
UVx6	U ₀₆	U ₀₄	U ₀₂	U ₀₀	U ₀₆	V ₀₆
UVx5	V ₀₇	V ₀₅	V ₀₃	V ₀₁	U ₀₅	V ₀₅
UVx4	V ₀₆	V ₀₄	V ₀₂	V ₀₀	U ₀₄	V ₀₄
UVx3					U ₀₃	V ₀₃
UVx2					U ₀₂	V ₀₂
UVx1					U ₀₁	V ₀₁
UVx0					U ₀₀	V ₀₀

Y_x,UV_x : x : A,B

X_{ab}: X: signal component a: sample number b: bit number

The amplitude resolution for each input signal component is 8 bit, the maximum clock frequency is 30 MHz. Consequently the SDA 9270 is dedicated for applications in high quality digital video systems. The data input stages and the internal data multiplexer operate with a special input clock (SCA). For applications in the Siemens MEGAVISION System the SCA-clock is identical with the memory output clock.

2.2 Output Data Format

The data format for the output channel Q will be a 4:2:2 parallel format in 2's complement code representation.

Data Pin	4:2:2 Parallel	
YQ7	Y ₀₇	Y ₁₇
YQ6	Y ₀₆	Y ₁₆
YQ5	Y ₀₅	Y ₁₅
YQ4	Y ₀₄	Y ₁₄
YQ3	Y ₀₃	Y ₁₃
YQ2	Y ₀₂	Y ₁₂
YQ1	Y ₀₁	Y ₁₁
YQ0	Y ₀₀	Y ₁₀
UVQ7	U ₀₇	V ₀₇
UVQ6	U ₀₆	V ₀₆
UVQ5	U ₀₅	V ₀₅
UVQ4	U ₀₄	V ₀₄

UVQ2	U ₀₂	V ₀₂
UVQ1	U ₀₁	V ₀₁
UVQ0	U ₀₀	V ₀₀

X_{ab}: X: signal component a: sample number b: bit number

2.3 Field Interpolation and Switching

In order to reduce the annoying line and edge flickering a frame rate upconversion is implemented. The upconversion includes a combination of interpolation algorithms which are determined via I²C-Bus and then selected automatically depending on the picture motion content.

The field interpolation and switching block accepts at its input the data of the two channels A and B, which are the combined luminance and chrominance information respectively of the field A and the field B. The field rate is 100/120 Hz.

A fallback mode which corresponds to the operating mode AABB of the original MEGAVISION system is made available. This mode is selected automatically in case of non-standard input signals carrying unstable sync informations or it can be forced via I²C-Bus.

2.4 Motion Detection

The motion detection output is switched in a 25/30 Hz frame synchronous raster. As input signals for this block are accepted the luminance signal components of the input channels A and B. By comparing the two fields the motion detector generates an information about 3 possible motion content levels: LOW, MEDIUM and HIGH.

2.5 Field Memory Control

The Field Mixer SDA 9270 has to provide the two external field memories – composed of TV-SAM SDA 9251 – with two pairs of control signals. One pair RENA and RENB enables the MEGAVISION system to write the incoming field A and field B information alternately into one field memory block and then into the other. A second pair of control signals OEBA and OEBA enables alternately the output back channels of field memory A and B for the noise reduction in the Picture Processor SDA 9290. Because of the timing the serial address signals SAC and SAR generated by the MSC SDA 9220 must be delayed by 4 SCAD-clock periods. This delay is implemented in the SDA 9270.

The Sync signals VS1 and BLN and the clock signal SCAD are used as timing reference signals.

2.6 Frame Synchronization

In order to synchronize the data flows within field memories and Field Mixer and to coordinate the signal information with the associated deflection control the Field Mixer SDA 9270 has to generate 25 Hz picture frame sync signals.

One 25 Hz frame sync signal is necessary for generating the field memory control signals RENA, RENB, OEBA, OEBA with a pattern repetition of 25 Hz each. This signal is synchronized to the front end side video signal of the MEGAVISION block and uses therefore as input signals the 50 Hz vertical sync signal VS1 generated by the MSC SDA 9220 and the horizontal blanking signal BLN.

A second 25 Hz frame sync signal is needed in the interpolation and switching block and in the VS3 pulse generation block for assuring an output data sequence of the channel Q synchronized with the VS3 pulse. As reference signals for this second frame sync signal are used the 100 Hz vertical sync signal VS2 and the blanking signal BLN2 both generated by the MSC SDA 9220.

2.7 SYNC-Signal Generation

This functional block generates a couple of sync signal needed in the processing stages following the Field Mixer device. This couple includes the vertical sync signal VS3 and the horizontal blanking signal BLN3. All these signals are synchronized with the output channel Q.

2.8 I²C-Bus

2.8.1 I²C-Bus Address

0	0	0	1	1	1	1
---	---	---	---	---	---	---

2.8.2 I²C-Bus Format

write:

S	0	0	0	1	1	1	1	0	A	Subaddress	A	Data Byte	A	*****	A	P
---	---	---	---	---	---	---	---	---	---	------------	---	-----------	---	-------	---	---

S: Start condition

A: Acknowledge

P: Stop condition

NA: Not Acknowledge

An automatical address increment function is implemented.

After switching on the IC (RES=0), all bits are set to defined states. Particularly:

Register	Default Value	Register	Default Value
00	00 _H	0B	50 _H
01	00 _H	0C	03 _H
02	00 _H	0D	0D _H
03	00 _H	0E	08 _H
04	40 _H	0F	28 _H
05	F4 _H	10	A5 _H
06	58 _H	11	55 _H
07	20 _H	12	0A _H
08	F8 _H	13	18 _H
09	70 _H	14	05 _H
0A	E8 _H	15	03 _H

D5..D4	MDTHU1	threshold for high degree of motion (large blocks) 00: 384 01: 512 (default value) 10: 640 11: 768
D3..D2	MDTHM2	threshold for second field difference (small blocks) 00: 64 01: 128 (default value) 10: 192 11: 256
D1..D0	MDTHM1	threshold for second field difference (large blocks) 00: 64 01: 128 (default value) 10: 192 11: 256

Subaddress 12

Bit	Name	Function
D5..D0	HYTHL1	hysteresis threshold, low degree of motion (large blocks) 000000: 1 000001: 1 000010: 2 : 111111: 63 (default value 001010)

Subaddress 13

Bit	Name	Function
D5..D0	HYTHL2	hysteresis threshold, low degree of motion (small blocks) 000000: 1 000001: 1 000010: 2 : 111111: 63 (default value 011000)

Subaddress 14

Bit	Name	Function
D5..D0	HYTHH1	hysteresis threshold, high degree of motion (large blocks) 000000: 1 000001: 1 000010: 2 : 111111: 63 (default value 000101)

Subaddress 15

Bit	Name	Function
D5..D0	HYTHH2	hysteresis threshold, high degree of motion (small blocks) 000000: 1 000001: 1 000010: 2 : 111111: 63 (default value 000011)

3 Electrical Characteristics

3.1 Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit	Remark
		min.	max.		
Operating temperature	T_A	0	70	°C	
Storage temperature	T_{stg}	- 65	125	°C	
Junction temperature	T_j		125	°C	
Soldering temperature	T_S		260	°C	
Soldering time	t_S		10	s	
Input voltage	V_I	- 0.3 V	$V_{DD} + 0.3 V$	V	V_{CC} respectively
Output voltage	V_Q	- 0.3 V	$V_{DD} + 0.3 V$	V	V_{CC} respectively
Supply voltages	V_S	- 0.3	6	V	
Supply voltage Differentials	V	- 0.25	0.25	V	between any internally non-connected supply pins of the same kind, see Pin Description
Total power dissipation	P_{tot}		1	W	
ESD protection	ESD	- 2	2	kV	MIL STD 883C method 3015.6, 100 pF, 1500 Ω
Latch-up protection		- 100	100	mA	all inputs/outputs

All voltages listed are referenced to ground (0 V, V_{SS}) except where noted.

Note: Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions or at any other condition beyond those indicated in the operational sections of this specification is not implied.

Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

3.2 Recommended Operating Conditions

Parameter	Symbol	Limit Values			Unit	Test Conditions
		min.	typ.	max.		
Supply voltages	V_{DD} V_{CC}	4.5	5	5.5	V	
Ambient temperature	T_A	0	25	70	°C	

All TTL Inputs

High-level input voltage	V_{IH}	2.0 V		V_{DD}	1	
Low-level input voltage	V_{IL}	0		0.8	V	
All TTL outputs						
High-level output voltage	V_{QH}	2.4			V	$I_{QH} = -2.0 \text{ mA}$
Low-level output voltage	V_{QL}			0.4	V	$I_{QL} = 3.0 \text{ mA}$

Clock TTL Inputs CLL, SCA, SCAD

Clock frequency		12	27	30	MHz	
Low time	t_{WL}	10			ns	Rise/fall time $\leq 5 \text{ ns}$
High time	t_{WH}	10			ns	
Rise time	t_{TLH}			5	ns	
Fall time	t_{THL}			5	ns	
SCA - CLL skew time	t_{SK}	0		15	ns	Diagram on page 22

I²C Bus (all values are referred to $\min(V_{IH})$ and $\max(V_{IL})$)

High-level input voltage	V_{IH}	3 V		V_{DD}	1	
Low-level input voltage	V_{IL}	0		1.5	V	
SCL clock frequency	f_{SCL}	0		400	kHz	
Inactive time before start of transmission	t_{BUF}	1.3			μs	
Set-up time start condition	$t_{SU;STA}$	0.6			μs	
Hold time start condition	$t_{HD;STA}$	0.6			μs	
SCL low time	t_{LOW}	1.3			μ	
SCL high time	t_{HIGH}	0.6			μs	
Set-up time DATA	$t_{SU;DAT}$	100			ns	

3.2 Recommended Operating Conditions (cont'd)

Parameter	Symbol	Limit Values			Unit	Test Conditions
		min.	typ.	max.		
Hold time DATA	$t_{HD;DAT}$	0			μs	
SDA/SCL rise times	t_R			300	ns	$f_{SCL} = 400 \text{ kHz}$
SDA/SCL fall times	t_F			300	ns	
Set-up time stop condition	$t_{SU;STO}$	0.6			μs	
Low-level output current	I_{OL}			3	mA	

Note: Under this conditions the functions given in the circuit description are fulfilled. Nominal conditions specify mean values expected over the production spread and are the proposed values for interface and application. If not stated otherwise, nominal values will apply at $T_A = 25 \text{ }^\circ\text{C}$ and the nominal supply voltage.

3.3 Characteristics (Assuming Recommended Operating Conditions)

Parameter	Symbol	Limit Values		Unit	Remark
		min.	max.		
Average supply current	I_S		200	mA	All V_{CC} and V_{DD} pins

All Digital Inputs (including I/O inputs)

Input capacitance	C_I		10	pF	Not tested; max. 7 pF for SCA, CLL
Input leakage current	I_I	- 10	10	μ A	

TTL Inputs: YA, YB, UVA, UVB (referenced to SCA)

Set-up time	t_{SU}	7		ns	
Input hold time	t_{IH}	6		ns	

TTL Inputs: REN, SACIN, SARIN (referenced to SCAD)

Set-up time	t_{SU}	7		ns	
Input hold time	t_{IH}	6		ns	

TTL Inputs: BLN, BLN2, VS1, VS2, ZM (referenced to CLL)

Note: For BLN a jitter of ± 1 CLL is allowed

Set-up time	t_{SU}	7		ns	
Input hold time	t_{IH}	6		ns	

TTL Outputs: YQ, UVQ (referenced to CLL)

Hold time	t_{QH}	6		ns	
Delay time	t_{QD}		25	ns	$C_L = 30$ pF

TTL Outputs: VS3, BLN3 (referenced to CLL)

Hold time	t_{QH}	6		ns	
Delay time	t_{QD}		25	ns	$C_L = 30$ pF

TTL Outputs: RENA, RENB, SACQ, SARQ (referenced to SCAD)

Hold time	t_{QH}	6		ns	
Delay time	t_{QD}		20	ns	$C_L = 50$ pF

3.3 Characteristics (Assuming Recommended Operating Conditions) (cont'd)

Parameter	Symbol	Limit Values		Unit	Remark
		min.	max.		

TTL Outputs: OEBA, OEBC (referenced to SCAD)

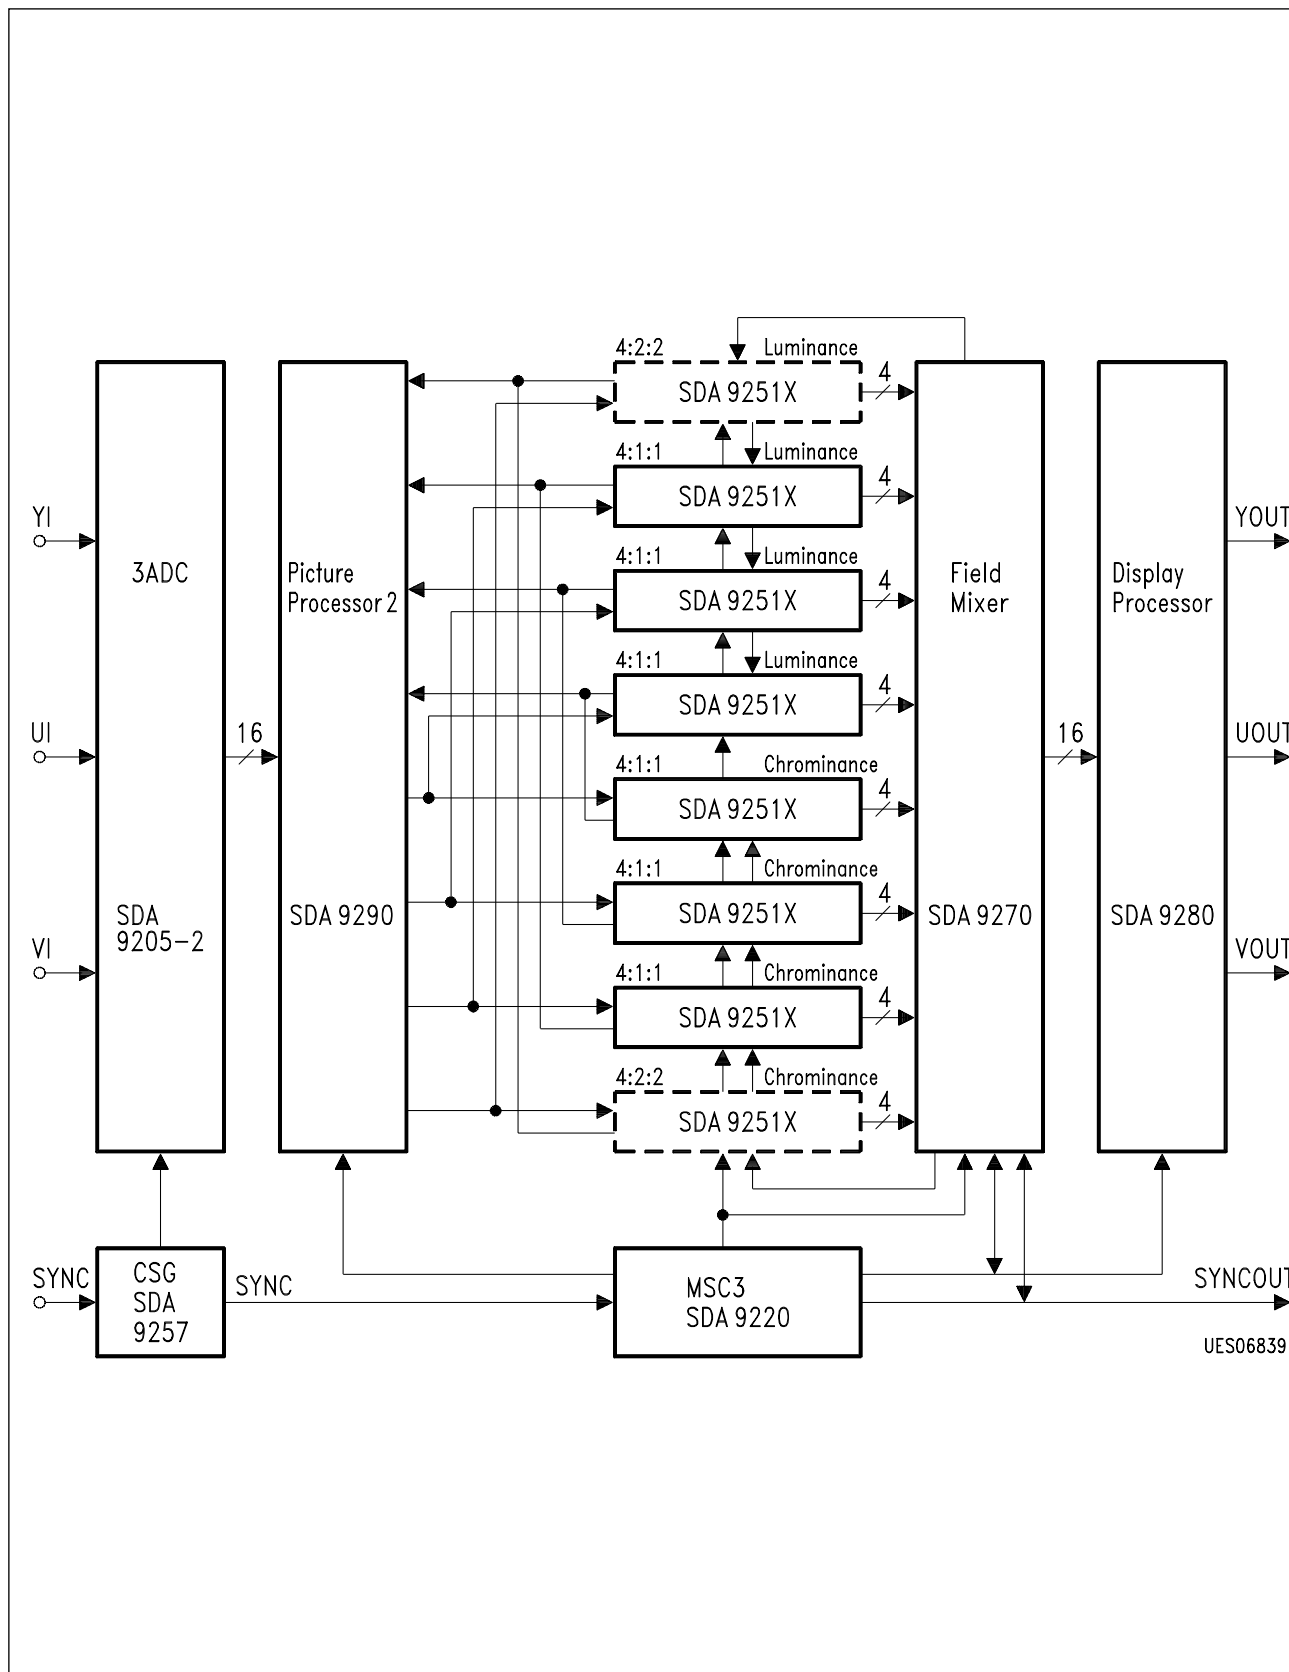

Hold time	t_{QH}	6		ns	
Delay time	t_{QD}		20	ns	$C_L = 30 \text{ pF}$

Input/Output: SDA (referenced to SCL; Open Drain Output)

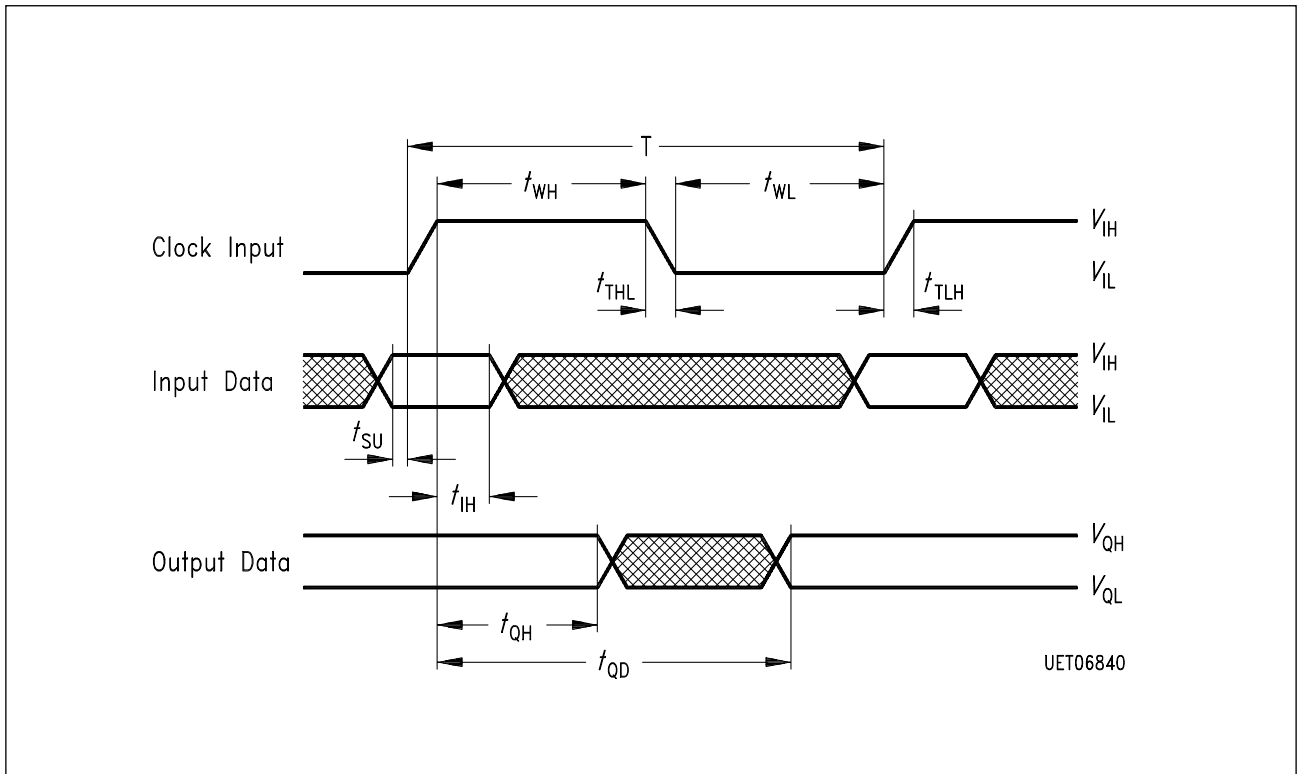

Low-level output voltage	V_{OL}		0.5	V	at $I_{OL} = \text{max}$
--------------------------	----------	--	-----	---	--------------------------

Note: The listed characteristics are ensured over the operating range of the integrated circuit.

6 Package Outlines

P-MQFP-80-1
(Plastic Metric Quad Flat Package)

1) Does not include plastic or metal protrusion of 0.25 max. per side

GPM05249

Sorts of Packing

Package outlines for tubes, trays etc. are contained in our Data Book "Package Information".

SMD = Surface Mounted Device

Dimensions in mm
