FAST PAGE MODE DYNAMIC RAM

MB8117800A-60/-70

CMOS 2,097,152 × 8 Bit Fast Page Mode Dynamic RAM

■ DESCRIPTION

The Fujitsu MB8117800A is a fully decoded CMOS Dynamic RAM (DRAM) that contains 16,777,216 memory cells accessible in 8-bit increments. The MB8117800A features a “fast page” mode of operation whereby high-speed random access of up to 1,024-bits of data within the same row can be selected. The MB8117800A DRAM is ideally suited for mainframe, buffers, hand-held computers video imaging equipment, and other memory applications where very low power dissipation and high bandwidth are basic requirements of the design. Since the standby current of the MB8117800A is very small, the device can be used as a non-volatile memory in equipment that uses batteries for primary and/or auxiliary power.

The MB8117800A is fabricated using silicon gate CMOS and Fujitsu’s advanced four-layer polysilicon and two-layer aluminum process. This process, coupled with advanced stacked capacitor memory cells, reduces the possibility of soft errors and extends the time interval between memory refreshes. Clock timing requirements for the MB8117800A are not critical and all inputs are TTL compatible.

■ PRODUCT LINE & FEATURES

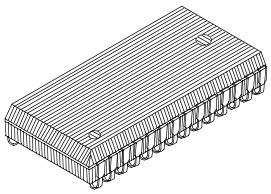
Parameter		MB8117800A-60	MB8117800A-70
$\overline{RAS}$ Access Time		60 ns max.	70 ns max.
Random Cycle Time		110 ns min.	130 ns min.
Address Access Time		30 ns max.	35 ns max.
$\overline{CAS}$ Access Time		15 ns max.	17 ns max.
Hyper Page Mode Cycle Time		40 ns min.	45 ns min.
Low Power Dissipation	Operating Current	715 mW max.	660 mW max.
	Standby Current	11 mW max. (TTL level) / 5.5 mW max. (CMOS level)	

- 2,097,152 words × 8 bit organization
- Silicon gate, CMOS, Advanced Capacitor Cell
- All input and output are TTL compatible
- 2048 refresh cycles every 32.8ms
- Self refresh function
- Early write or $\overline{OE}$ controlled write capability
- $\overline{RAS}$-only, $\overline{CAS}$-before-$\overline{RAS}$, or Hidden Refresh
- Fast Page Mode, Read-Modify-Write capability
- On chip substrate bias generator for high performance

MB8117800A-60/-70

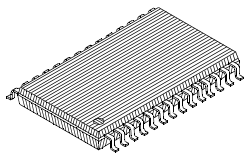
■ PACKAGE

28-pin plastic SOJ



(LCC-28P-M07)

28-pin plastic TSOP (II)



(FPT-28P-M14)
(Normal Bend)

Package and Ordering Information

– 28-pin plastic (400mil) SOJ, order as MB8117800A-××PJ
– 28-pin plastic (400mil) TSOP-II with normal bend leads, order as MB8117800A-××PFTN

MB8117800A-60/-70

■ FUNCTIONAL TRUTH TABLE

Operation Mode	Clock Input				Address		Input Data		Refresh	Note
	$\overline{RAS}$	$\overline{CAS}$	$\overline{WE}$	$\overline{OE}$	Row	Column	Input	Output		
Standby	H	H	X	X	—	—	—	High-Z	—	
Read Cycle	L	L	H	L	Valid	Valid	—	Valid	Yes*	$t_{RCS} \geq t_{RCS}$ (min)
Write Cycle (Early Write)	L	L	L	X	Valid	Valid	Valid	High-Z	Yes*	$t_{WCS} \geq t_{WCS}$ (min)
Read-Modify-Write Cycle	L	L	H→L	L→H	Valid	Valid	Valid	Valid	Yes*	
$\overline{RAS}$-only Refresh Cycle	L	H	X	X	Valid	—	—	High-Z	Yes	
$\overline{CAS}$-before-$\overline{RAS}$ Refresh Cycle	L	L	X	X	—	—	—	High-Z	Yes	$t_{CSR} \geq t_{CSR}$ (min)
Hidden Refresh Cycle	H→L	L	H→X	L	—	—	—	Valid	Yes	Previous data is kept.

X; “H” or “L”
*; It is impossible in Fast Page Mode.

■ FUNCTIONAL OPERATION

ADDRESS INPUTS

Twenty-one input bits are required to decode any eight of 16,777,216 cell addresses in the memory matrix. Since only eleven address bits (A0 to A10) are available, the row and column inputs are separately strobed by $\overline{RAS}$ and $\overline{CAS}$ as shown in Figure 1. First, eleven row address bits are input on pins A0-through-A10 and latched with the row address strobe ($\overline{RAS}$) then, ten column address bits are input and latched with the column address strobe ($\overline{CAS}$). Both row and column addresses must be stable on or before the falling edge of $\overline{RAS}$ and $\overline{CAS}$, respectively. The address latches are of the flow-through type; thus, address information appearing after t_{RAH} (min) + t_T is automatically treated as the column address.

WRITE ENABLE

The read or write mode is determined by the logic state of $\overline{WE}$. When $\overline{WE}$ is active Low, a write cycle is initiated; when $\overline{WE}$ is High, a read cycle is selected. During the read mode, input data is ignored.

DATA INPUTS

Input data is written into memory in either of three basic ways-an early write cycle, an $\overline{OE}$ (delayed) write cycle, and a read-modify-write cycle. The falling edge of $\overline{WE}$ or $\overline{CAS}$, whichever is later, serves as the input data-latch strobe. In an early write cycle, the input data (DQ_1-DQ_8) is strobed by $\overline{CAS}$ and the setup/hold times are referenced to $\overline{CAS}$ because $\overline{WE}$ goes Low before $\overline{CAS}$. In a delayed write or a read-modify-write cycle, $\overline{WE}$ goes Low after $\overline{CAS}$; thus, input data is strobed by $\overline{WE}$ and all setup/hold times are referenced to the write-enable signal.

DATA OUTPUTS

The three-state buffers are TTL compatible with a fanout of two TTL loads. Polarity of the output data is identical to that of the input; the output buffers remain in the high-impedance state until the column address strobe goes Low. When a read or read-modify-write cycle is executed, valid outputs are obtained under the following conditions:

t_{RAC} : from the falling edge of $\overline{RAS}$ when t_{RCD} (max) is satisfied.
t_{CAC} : from the falling edge of $\overline{CAS}$ when t_{RCD} is greater than t_{RCD} (max).
t_{AA} : from column address input when t_{RAD} is greater than t_{RAD} (max).
t_{OEA} : from the falling edge of $\overline{OE}$ when $\overline{OE}$ is brought Low after t_{RAC}, t_{CAC}, or t_{AA}.

The data remains valid until either $\overline{CAS}$ or $\overline{OE}$ returns to a High logic level. When an early write is executed, the output buffers remain in a high-impedance state during the entire cycle.

FAST PAGE MODE OF OPERATION

The fast page mode of operation provides faster memory access and lower power dissipation. The fast page mode is implemented by keeping the same row address and strobing in successive column addresses. To satisfy these conditions, $\overline{RAS}$ is held Low for all contiguous memory cycles in which row addresses are common. For each fast page of memory, any of 1,024 x 8-bits can be accessed and, when multiple MB8117800As are used, $\overline{CAS}$ is decoded to select the desired memory fast page. Fast page mode operations need not be addressed sequentially and combinations of read, write, and/or read-modify-write cycles are permitted.

■ ABSOLUTE MAXIMUM RATINGS (See WARNING)

Parameter	Symbol	Value	Unit
Voltage at any pin relative to V_{SS}	V_{IN}, V_{OUT}	–0.5 to +7.0	V
Voltage of V_{CC} supply relative to V_{SS}	V_{CC}	–0.5 to +7.0	V
Power Dissipation	P_D	1.0	W
Short Circuit Output Current	—	50	mA
Operating Temperature	T_{OPE}	0 to 70	°C
Storage Temperature	T_{STG}	–55 to +125	°C

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Notes	Symbol	Min.	Typ.	Max.	Unit	Ambient Operating Temp
Supply Voltage	*1	V_{CC}	4.5	5.0	5.5	V	0°C to + 70°C
		V_{SS}	0	0	0		
Input High Voltage, all inputs	*1	V_{IH}	2.4	—	6.5	V	
Input Low Voltage, all inputs*	*1	V_{IL}	–3.0	—	0.8	V	

* : Undershoots of up to –2.0 volts with a pulse width not exceeding 20 ns are acceptable.

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

■ CAPACITANCE

(T_A = 25°C, f = 1 MHz)

Parameter	Symbol	Max.	Unit
Input Capacitance, A_0 to A_{10}	C_{IN1}	5	pF
Input Capacitance, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$	C_{IN2}	5	pF
Input/Output Capacitance, DQ_1 to DQ_8	C_{DQ}	7	pF

66	Fast Page Mode $\overline{CAS}$ Precharge to $\overline{WE}$ Delay Time		t_{CPWD}	55	—	62	—	ns

Notes: *1. Referenced to V_{SS}.

*2. I_{CC} depends on the output load conditions and cycle rates; The specified values are obtained with the output open. I_{CC} depends on the number of address change as $\overline{RAS}$ = V_{IL}, $\overline{CAS}$ = V_{IH} and V_{IL} > –0.3 V. I_{CC1}, I_{CC3}, I_{CC4} and I_{CC5} are specified at one time of address change during $\overline{RAS}$ = V_{IL} and $\overline{CAS}$ = V_{IH}. I_{CC2} is specified during $\overline{RAS}$ = V_{IH} and V_{IL} > –0.3 V.

*3. An initial pause ($\overline{RAS}$ = $\overline{CAS}$ = V_{IH}) of 200 µs is required after power-up followed by any eight $\overline{RAS}$-only cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of eight $\overline{CAS}$-before-$\overline{RAS}$ initialization cycles instead of 8 $\overline{RAS}$ cycles are required.

*4. AC characteristics assume t_T = 5 ns.

*5. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also transition times are measured between V_{IH} (min) and V_{IL} (max).

*6. Assumes that $t_{RCD} \leq t_{RCD}$ (max), $t_{RAD} \leq t_{RAD}$ (max). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will be increased by the amount that t_{RCD} exceeds the value shown. Refer to Fig.2 and 3.

*7. If $t_{RCD} \geq t_{RCD}$ (max), $t_{RAD} \geq t_{RAD}$ (max), and $t_{ASC} \geq t_{AA} - t_{CAC} - t_T$, access time is t_{CAC}.

*8. If $t_{RAD} \geq t_{RAD}$ (max) and $t_{ASC} \leq t_{AA} - t_{CAC} - t_T$, access time is t_{AA}.

*9. Measured with a load equivalent to two TTL loads and 100 pF.

*10. t_{OFF} and t_{OEZ} is specified that output buffer change to high impedance state.

*11. Operation within the t_{RCD} (max) limit ensures that t_{RAC} (max) can be met. t_{RCD} (max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (max) limit, access time is controlled exclusively by t_{CAC} or t_{AA}.

*12. t_{RCD} (min) = t_{RAH} (min) + 2 t_T + t_{ASC} (min).

*13. Operation within the t_{RAD} (max) limit ensures that t_{RAC} (max) can be met. t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, access time is controlled exclusively by t_{CAC} or t_{AA}.

*14. Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.

*15. t_{WCS} is specified as a reference point only. If $t_{WCS} \geq t_{WCS}$ (min) the data output pin will remain High-Z state through entire cycle.

*16. Assumes that $t_{WCS} < t_{WCS}$ (min).

*17. Either t_{DZC} or t_{DZO} must be satisfied.

*18. t_{CPA} is access time from the selection of a new column address (that is caused by changing $\overline{CAS}$ from “L” to “H”). Therefore, if t_{CP} is long, t_{CPA} is longer than t_{CPA} (max).

*19. Assumes that $\overline{CAS}$-before-$\overline{RAS}$ refresh.

*20. t_{WCS}, t_{CWD}, t_{RWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristic only. If $t_{WCS} \geq t_{WCS}$ (min), the cycle is an early write cycle and D_{OUT} pin will maintain high impedance state through-out the entire cycle. If $t_{CWD} \geq t_{CWD}$ (min), $t_{RWD} \geq t_{RWD}$ (min), $t_{AWD} \geq t_{AWD}$ (min) and $t_{CPWD} \geq t_{CPWD}$ (min), the cycle is a read-modify-write cycle and data from the selected cell will appear at the D_{OUT} pin. If neither of the above conditions is satisfied, the cycle is a delayed write cycle and invalid data will appear the D_{OUT} pin, and write operation can be executed by satisfying t_{RWL}, t_{CWL}, and t_{RAL} specifications.

MB8117800A-60/-70

Fig. 2 – t_{RAC} vs. t_{RCD}

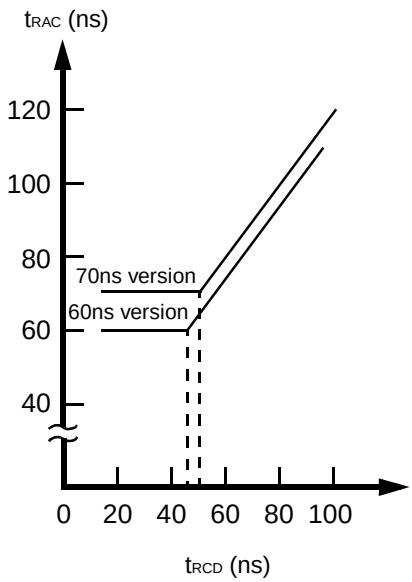

Fig. 3 – t_{RAC} vs. t_{RAD}

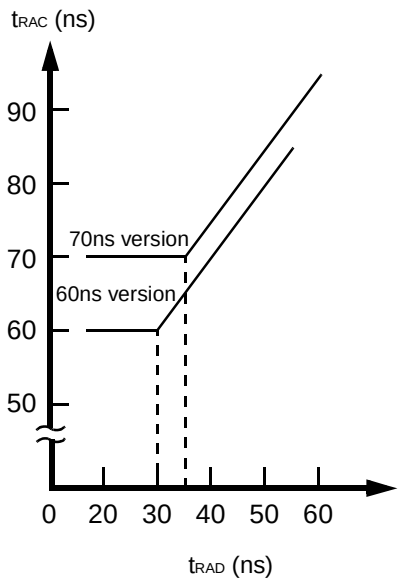

Fig. 4 – t_{CPA} vs. t_{CP}

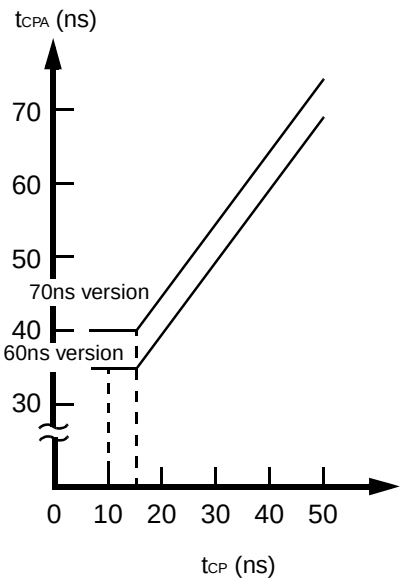
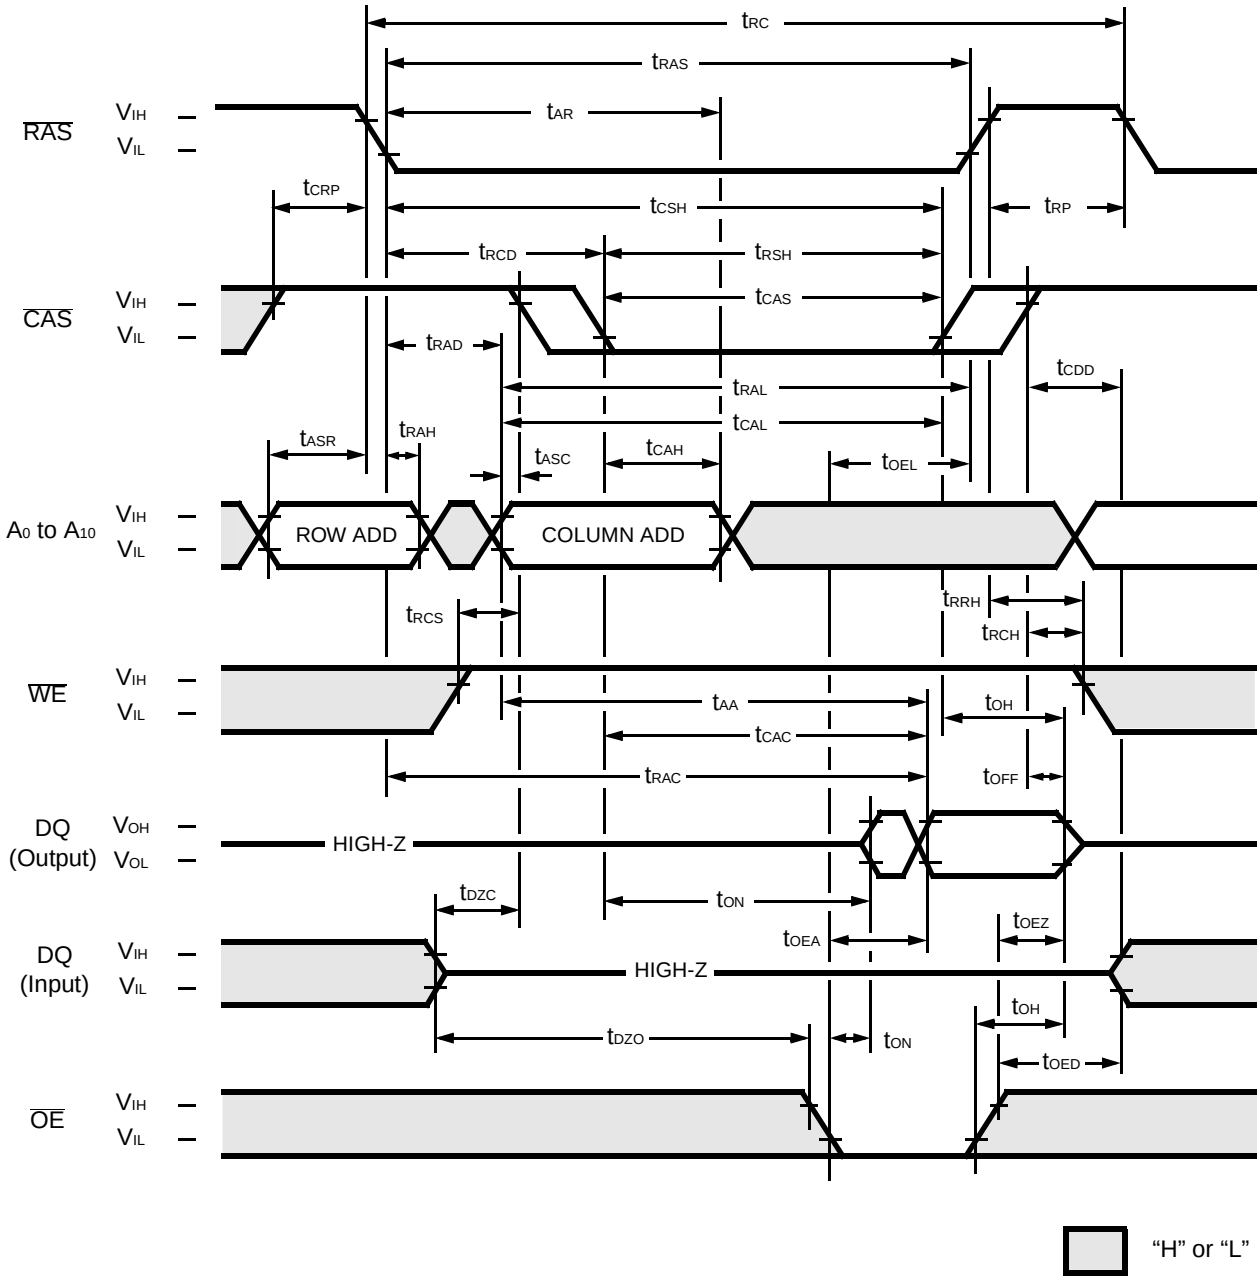


MB8117800A-60/-70

Fig. 5 – READ CYCLE



DESCRIPTION

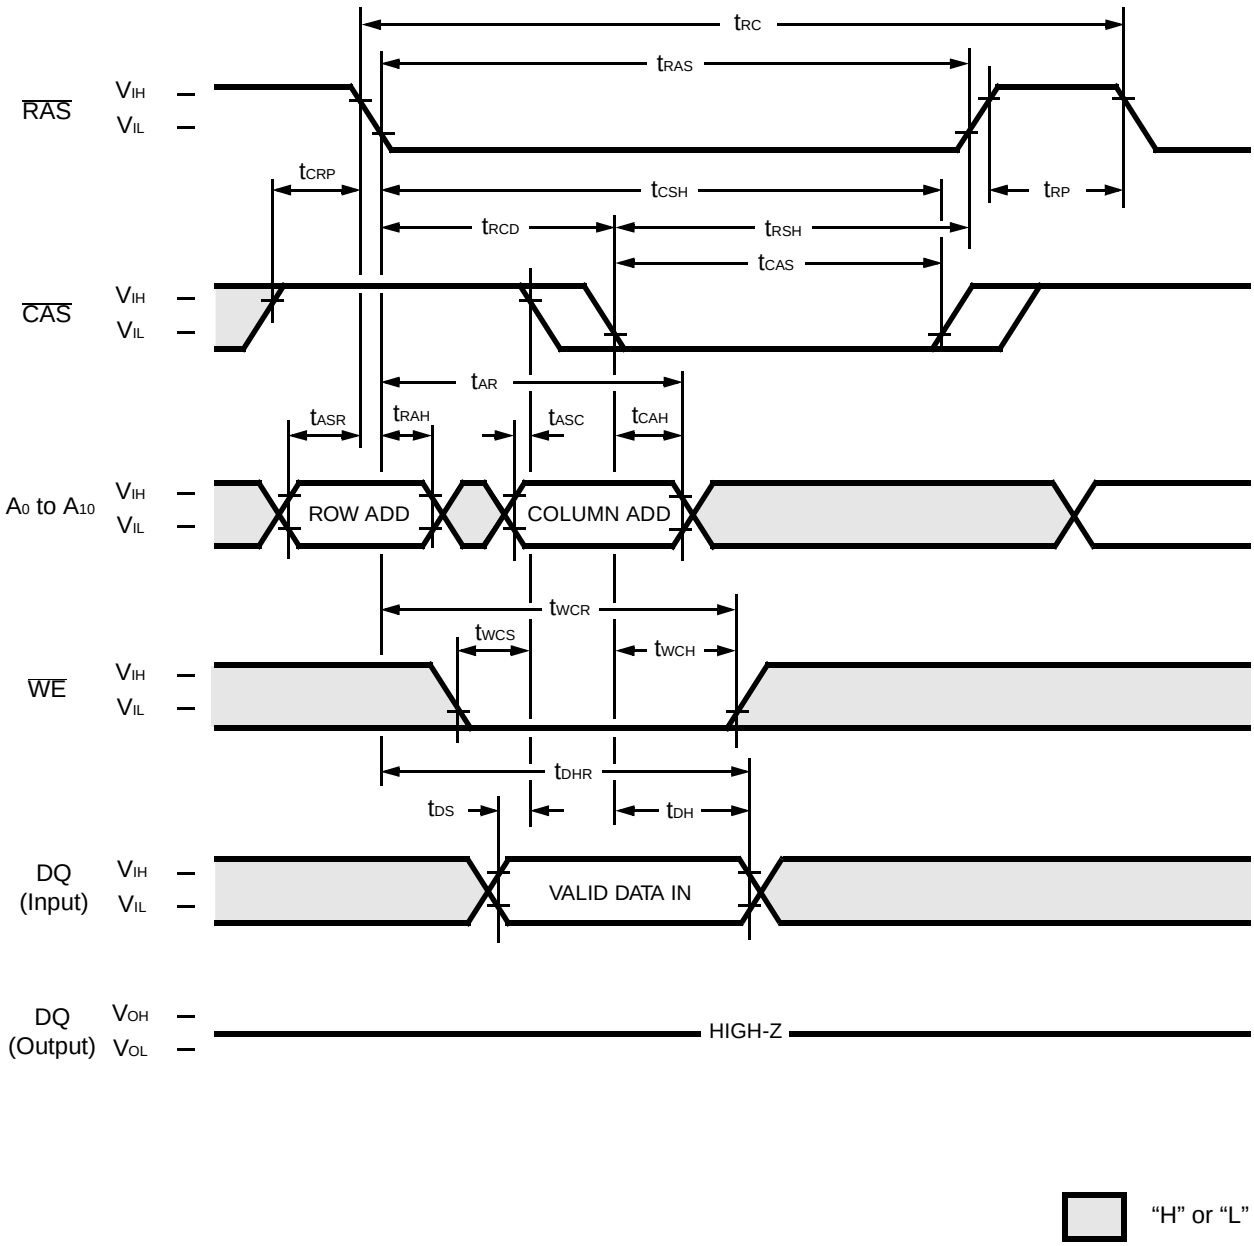
To implement a read operation, a valid address is latched in by the $\overline{RAS}$ and $\overline{CAS}$ address strobes and with $\overline{WE}$ set to a High level and $\overline{OE}$ set to a low level, the output is valid once the memory access time has elapsed. The access time is determined by $\overline{RAS}$(t_{RAC}), $\overline{CAS}$(t_{CAC}), $\overline{OE}$(t_{OEA}) or column addresses (t_{AA}) under the following conditions:

If $t_{RCD} > t_{RCD}$ (max), access time = t_{CAC}.
If $t_{RAD} > t_{RAD}$ (max), access time = t_{AA}.
If $\overline{OE}$ is brought Low after t_{RAC}, t_{CAC}, or t_{AA}(whichever occurs later), access time = t_{OEA}.

However, if either $\overline{CAS}$ or $\overline{OE}$ goes High, the output returns to a high-impedance state after t_{OH} is satisfied.

MB8117800A-60/-70

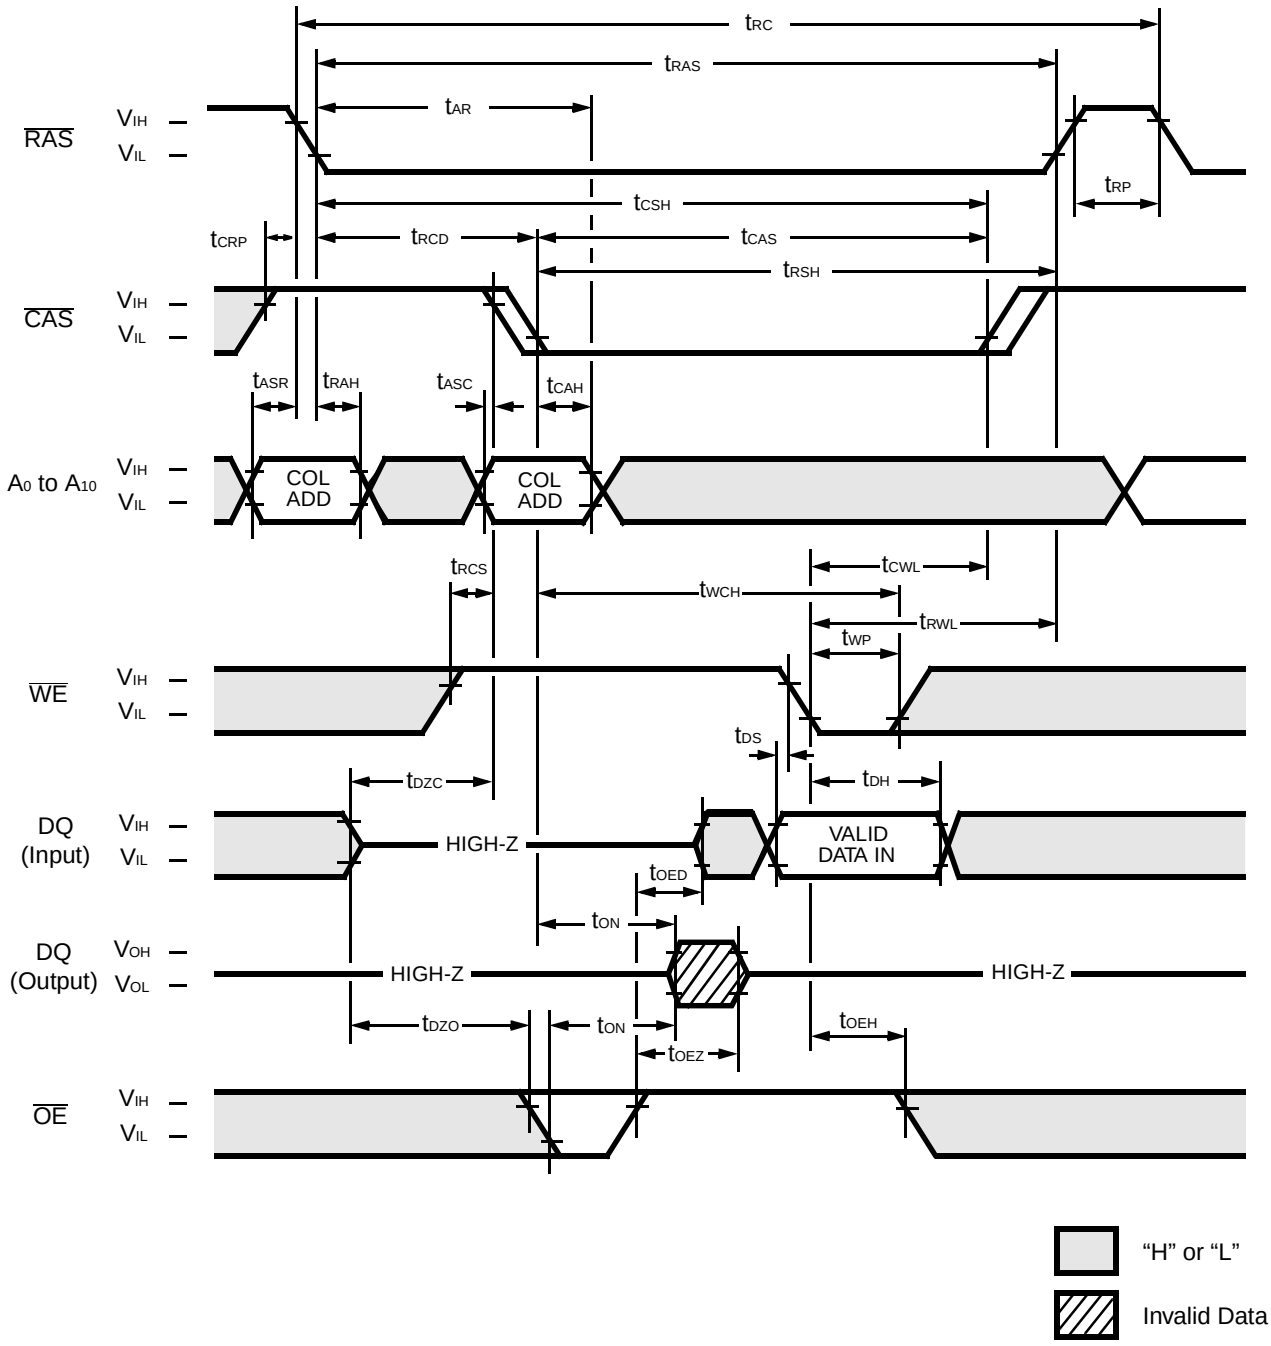
Fig. 6 – EARLY WRITE CYCLE ($\overline{OE}$ = "H" or "L")



DESCRIPTION

A write cycle is similar to a read cycle except $\overline{WE}$ is set to a Low state and $\overline{OE}$ is an "H" or "L" signal. A write cycle can be implemented in either of three ways - early write, delayed write or read-modify-write. During all write cycles, timing parameters t_{RWL}, t_{CWL}, and t_{RAL} must be satisfied. In the early write cycle shown above t_{WCS} satisfied, data on the DQ pin is latched with the falling edge of $\overline{CAS}$ and written into memory.

Fig. 7 – DELAYED WRITE CYCLE

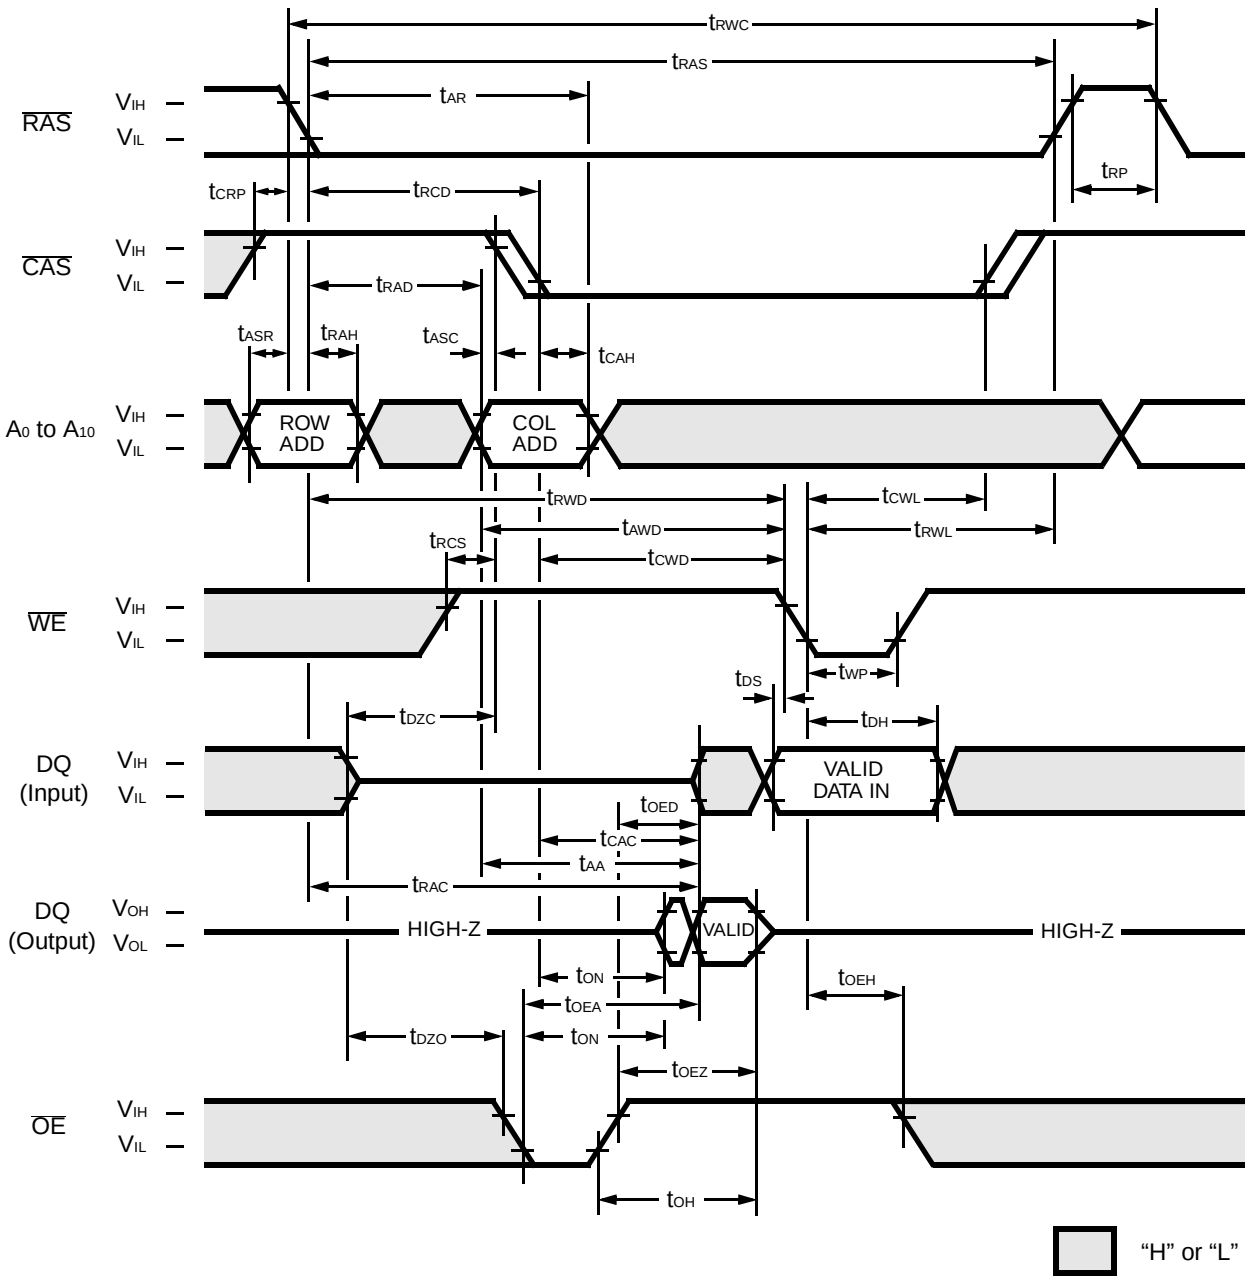


DESCRIPTION

In the delayed write cycle, t_{WCS} is not satisfied; thus, the data on the DQ pins is latched with the falling edge of $\overline{WE}$ and written into memory. The Output Enable ($\overline{OE}$) signal must be changed from Low to High before $\overline{WE}$ goes Low ($t_{OED} + t_{DS}$).

MB8117800A-60/-70

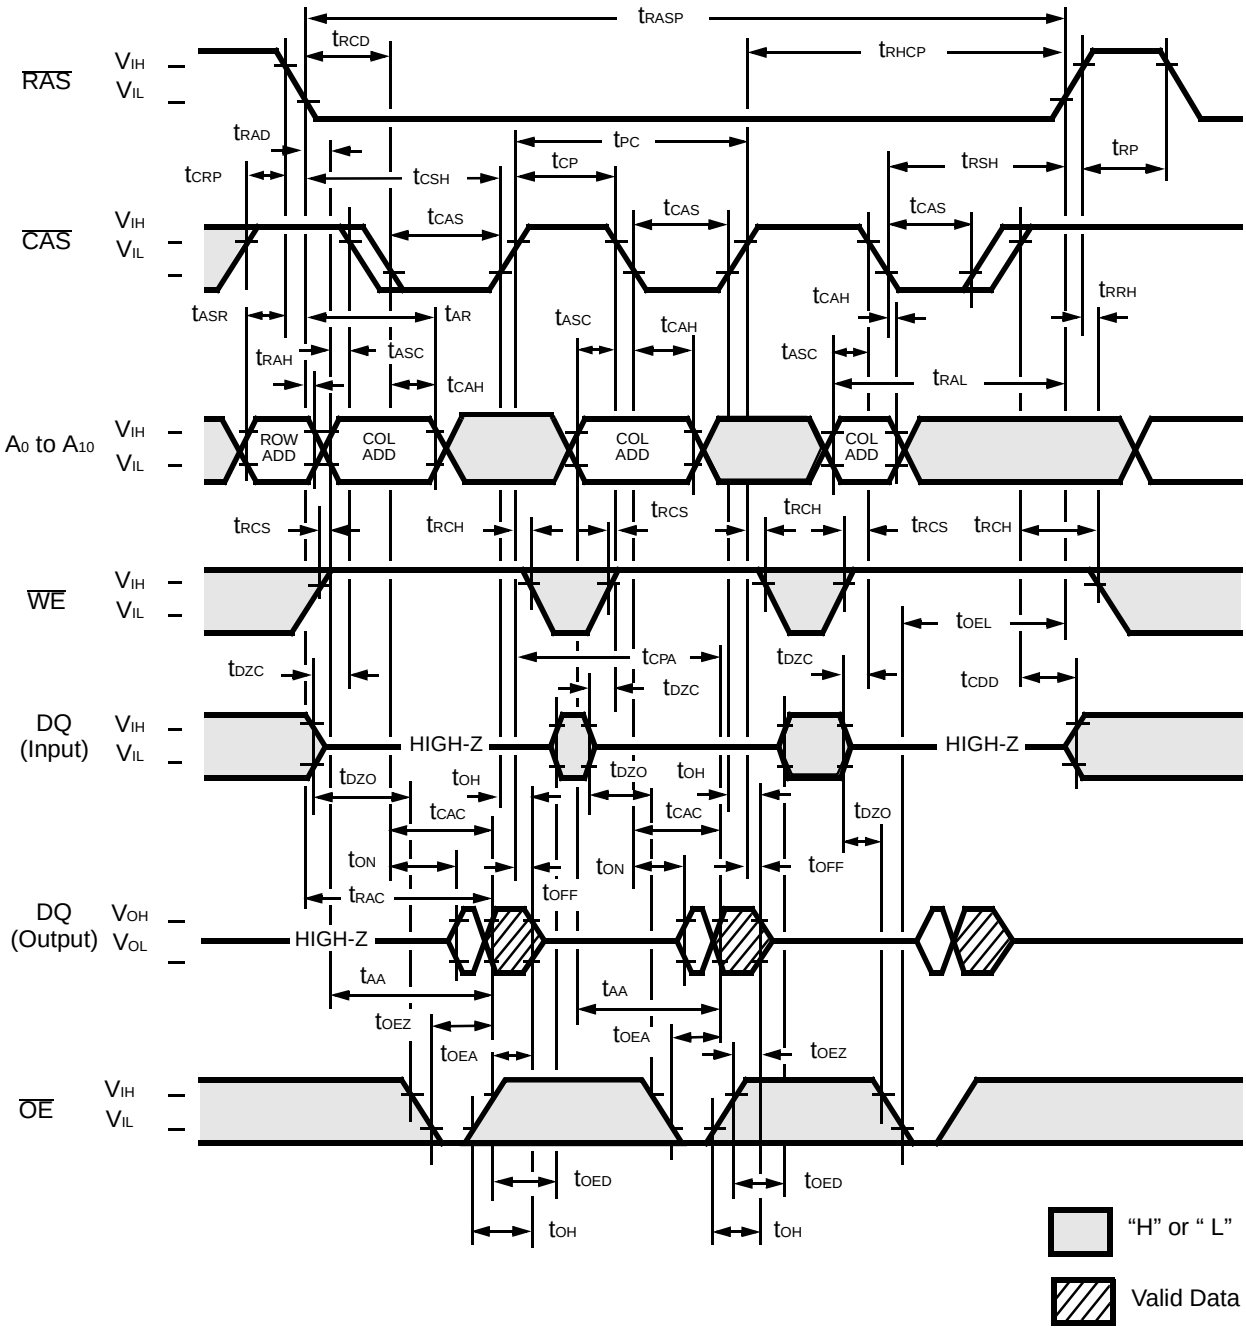
Fig. 8 – READ-MODIFY-WRITE CYCLE



DESCRIPTION

The read-modify-write cycle is executed by changing $\overline{WE}$ from High to Low after the data appears on the DQ pins. In the read-modify-write cycle, $\overline{OE}$ must be changed from Low to High after the memory access time.

Fig. 9 – FAST PAGE MODE READ CYCLE

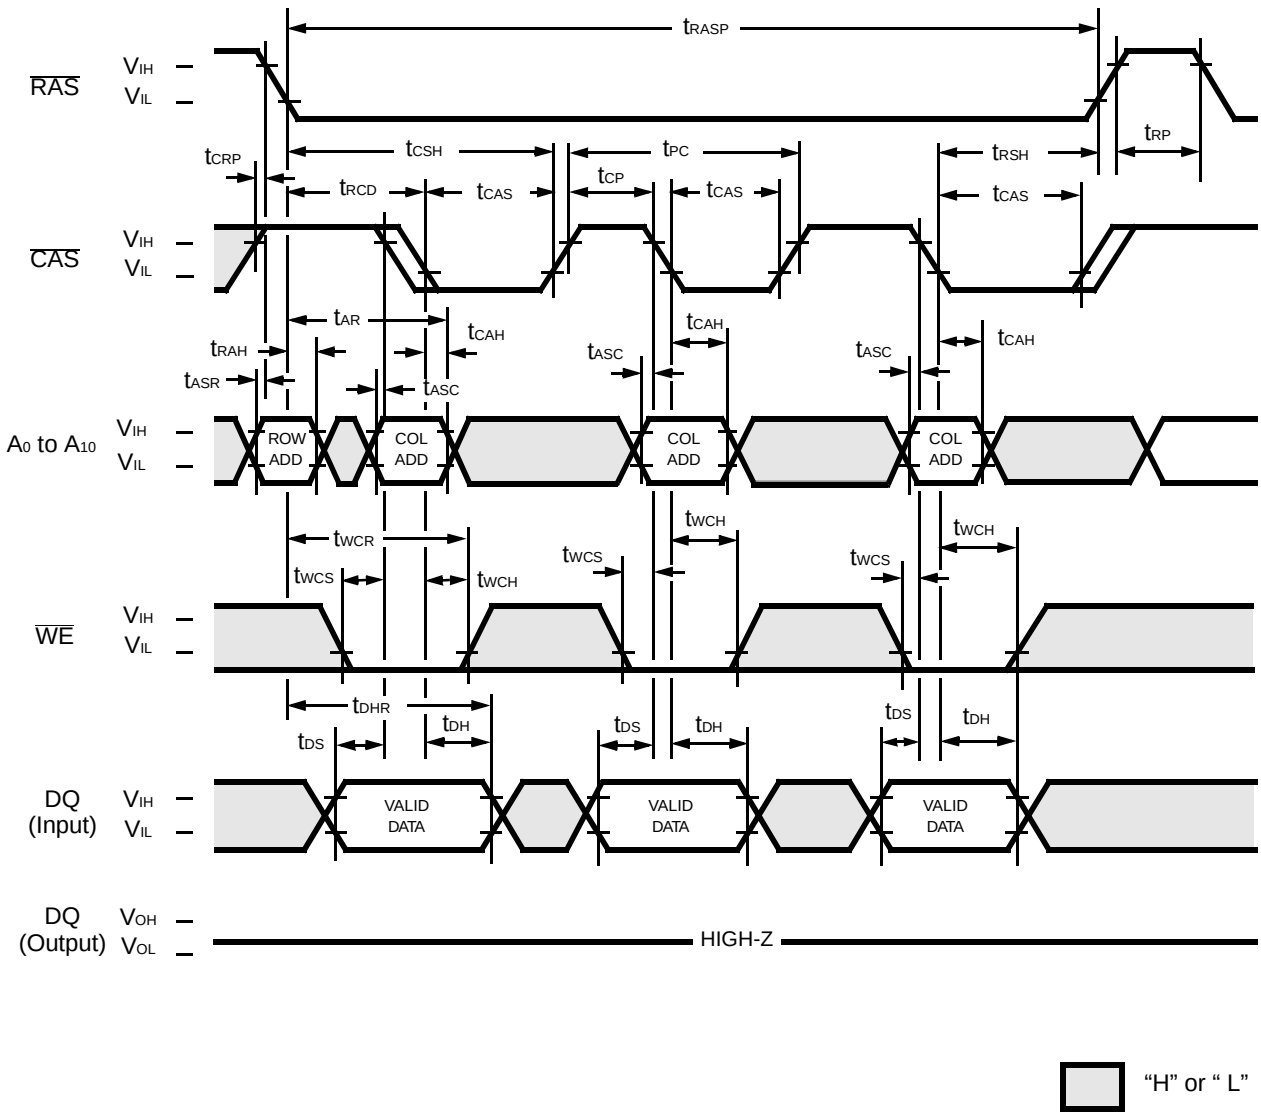


DESCRIPTION

The fast page mode of operation permits faster sucessive memory operations at multiple column locations of the same row address. This operations is performed by strobing in the row address and maintaining $\overline{RAS}$ at a Low level and $\overline{WE}$ at a Hight level druing all successive memory cycles in which the row address is latched. The address time is determined by t_{CAC}, t_{AA}, t_{CPA}, or t_{OEA}, whichever one is the latest in occurring.

MB8117800A-60/-70

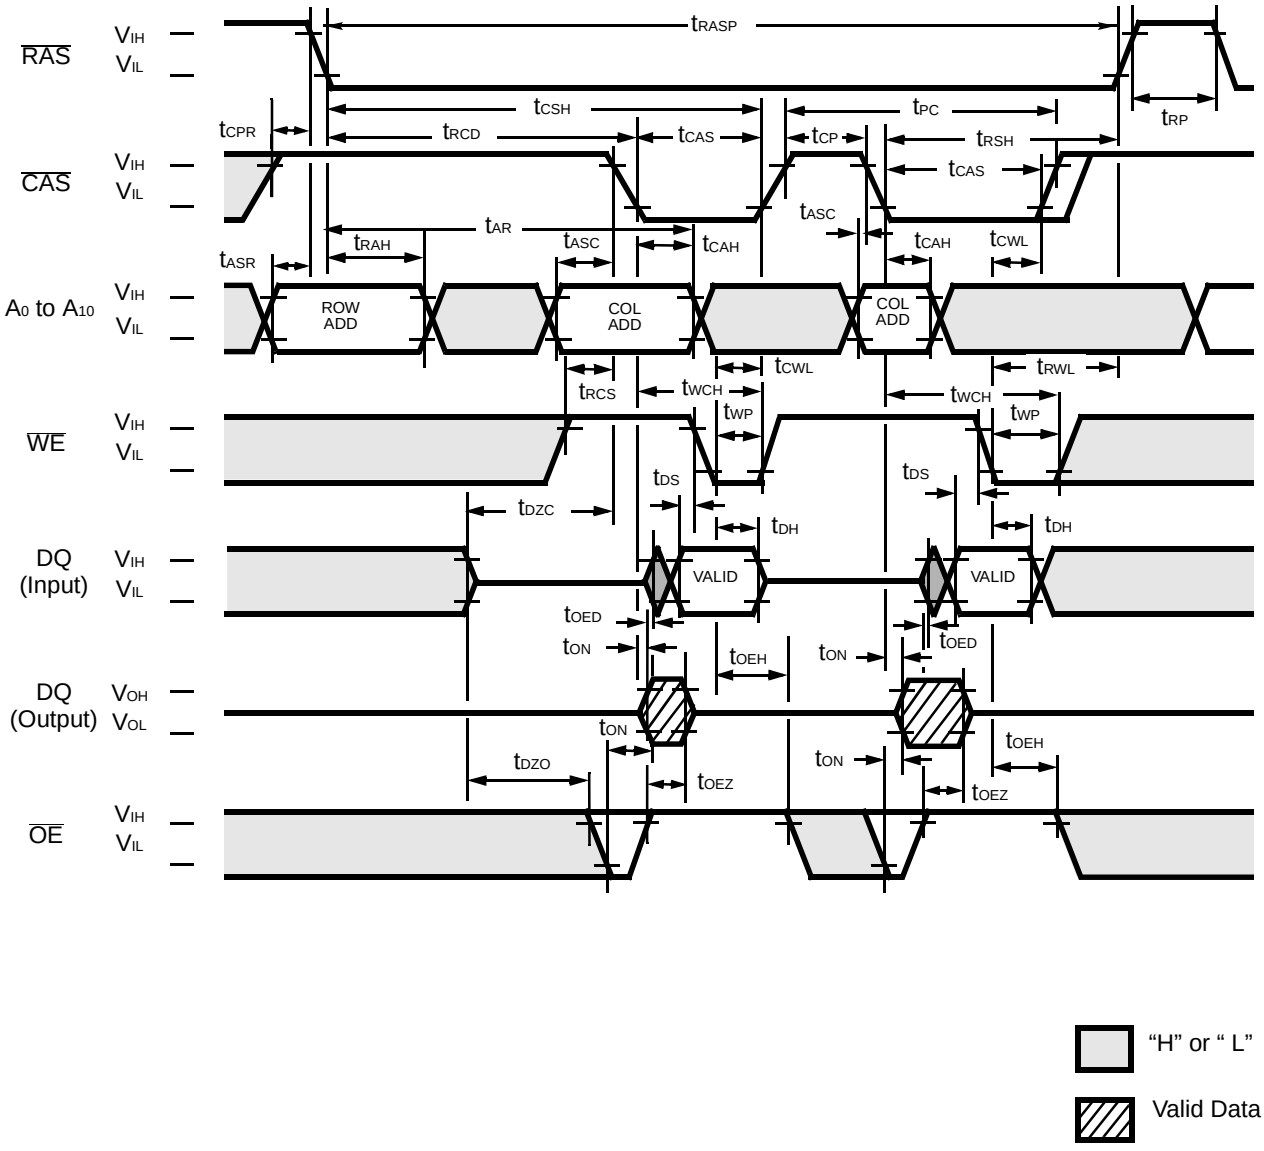
Fig. 10 – FAST PAGE MODE EARLY WRITE CYCLE ($\overline{OE}$ = "H" or "L")



DESCRIPTION

The fast page mode early write cycle is executed in the same manner as the fast page mode read cycle except the states of $\overline{WE}$ and $\overline{OE}$ are reversed. Data appearing on the DQ pins is latched on the falling edge of $\overline{CAS}$ and written into memory. During the fast page mode early write cycle, including the delayed ($\overline{OE}$) write and read-modify-write cycles, t_{CWL} must be satisfied.

Fig. 11 – FAST PAGE MODE DELAYED WRITE CYCLE

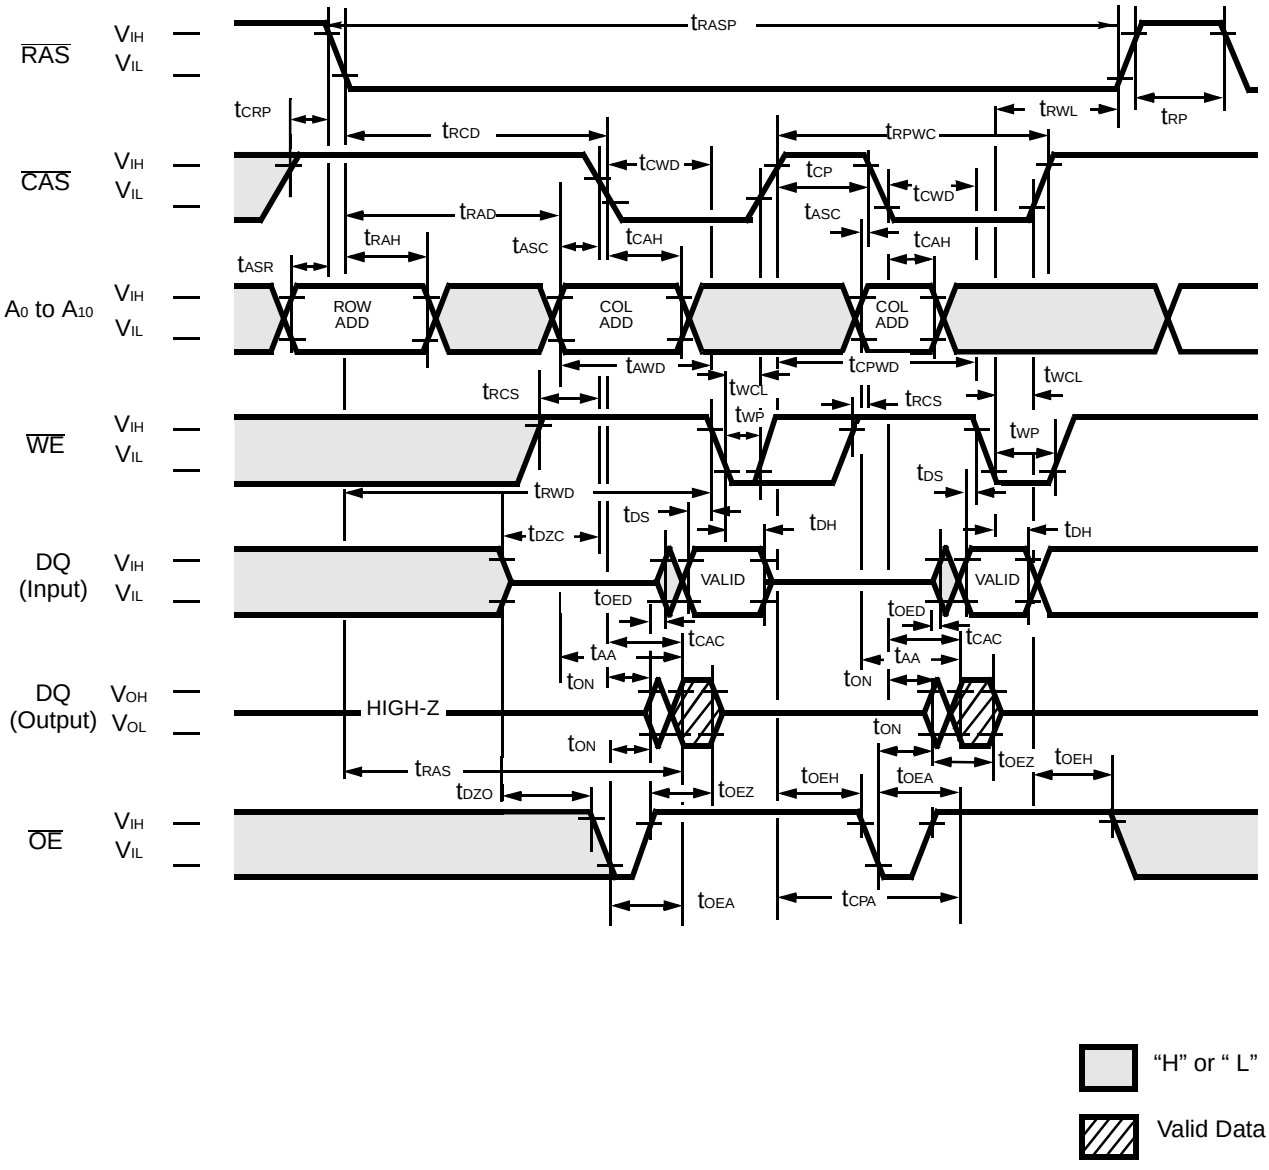


DESCRIPTION

The fast page mode delayed write cycle is executed in the same manner as the fast page mode early write cycle except for the states of $\overline{WE}$ and $\overline{OE}$. Input data on the DQ pins are latched on the falling edge of $\overline{WE}$ and written into memory. In the fast page mode delayed write cycle, $\overline{OE}$ must me changed from Low to High before $\overline{WE}$ goes Low ($t_{OED} + t_T + t_{DS}$).

MB8117800A-60/-70

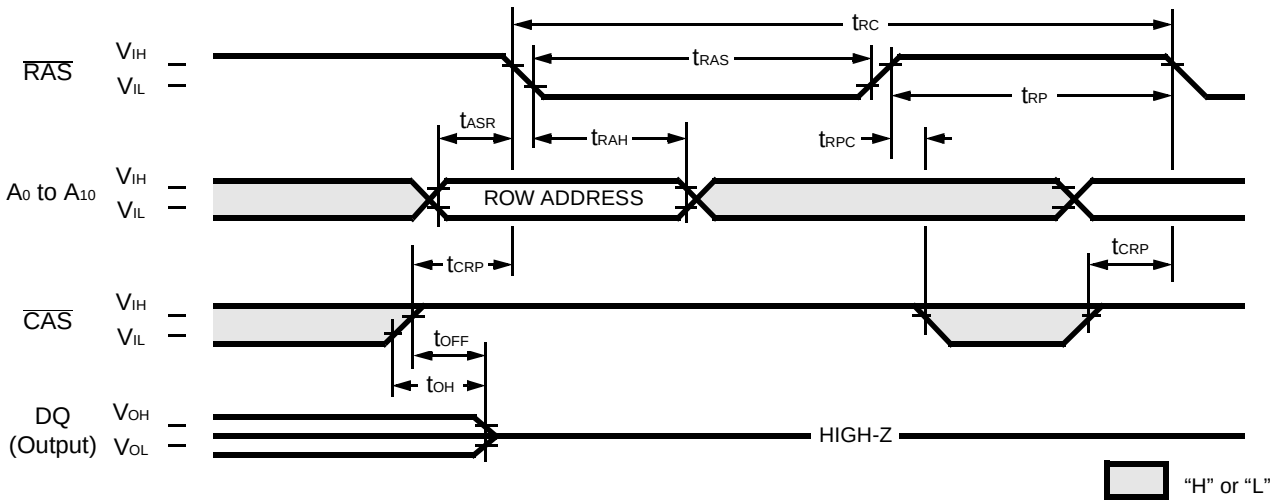
Fig. 12 – FAST PAGE MODE READ-MODIFY-WRITE CYCLE



DESCRIPTION

During the fast page mode of operation, the read-modify-write cycle can be executed by switching $\overline{WE}$ from High to Low after input data appears at the DQ pins during a normal cycle.

Fig. 13 – $\overline{RAS}$-ONLY REFRESH ($\overline{WE}$ = $\overline{OE}$ = "H" or "L")

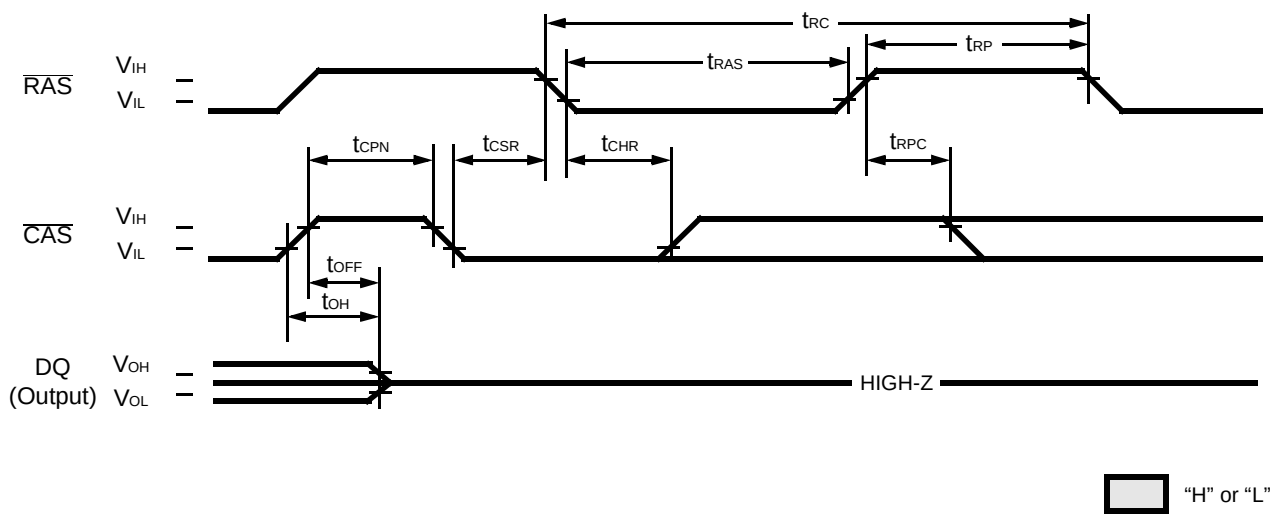


DESCRIPTION

Referesh of RAM memory cells is accomplished by performing a read, a write, or a read-modify-write cycle at each of 2048 row addresses every 32.8-milliseconds. Three refresh modes are available: $\overline{RAS}$-only refresh, $\overline{CAS}$-before-$\overline{RAS}$ refresh, and hidden refresh.

$\overline{RAS}$-only refresh is performed by keeping $\overline{RAS}$ Low and $\overline{CAS}$ High throughout the cycle; the row address to be refreshed is latched on the falling edge of $\overline{RAS}$. During $\overline{RAS}$-only refresh, D_{OUT} pins are kept in a high-impedance state.

Fig. 14 – $\overline{CAS}$-BEFORE-$\overline{RAS}$ REFRESH (ADDRESSES = $\overline{WE}$ = $\overline{OE}$ = "H" or "L")

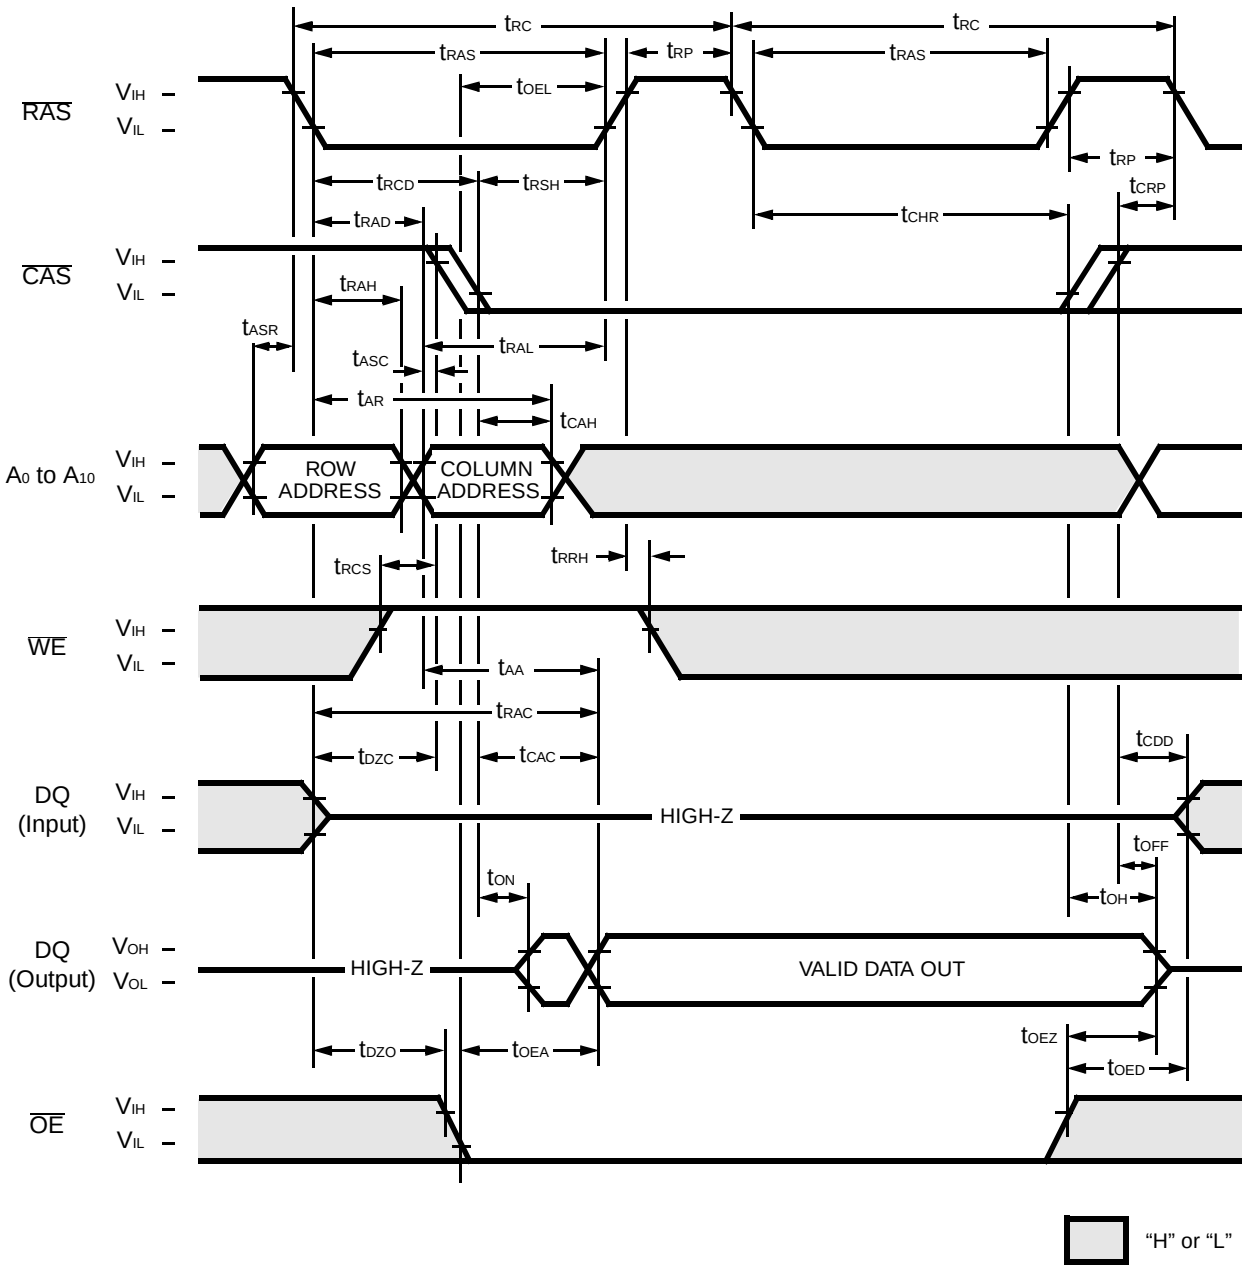


DESCRIPTION

$\overline{CAS}$-before-$\overline{RAS}$ refresh is an on-chip refresh capability that eliminates the need for external refresh addresses. If $\overline{CAS}$ is held Low for the specified setup time (t_{CSR}) before $\overline{RAS}$ goes Low, the on-chip refresh control clock generators and refresh address counter are enabled. An internal refresh operating automatically occurs and the refresh address counter is internally incremented in preparation for the next $\overline{CAS}$-before-$\overline{RAS}$ refresh operation.

MB8117800A-60/-70

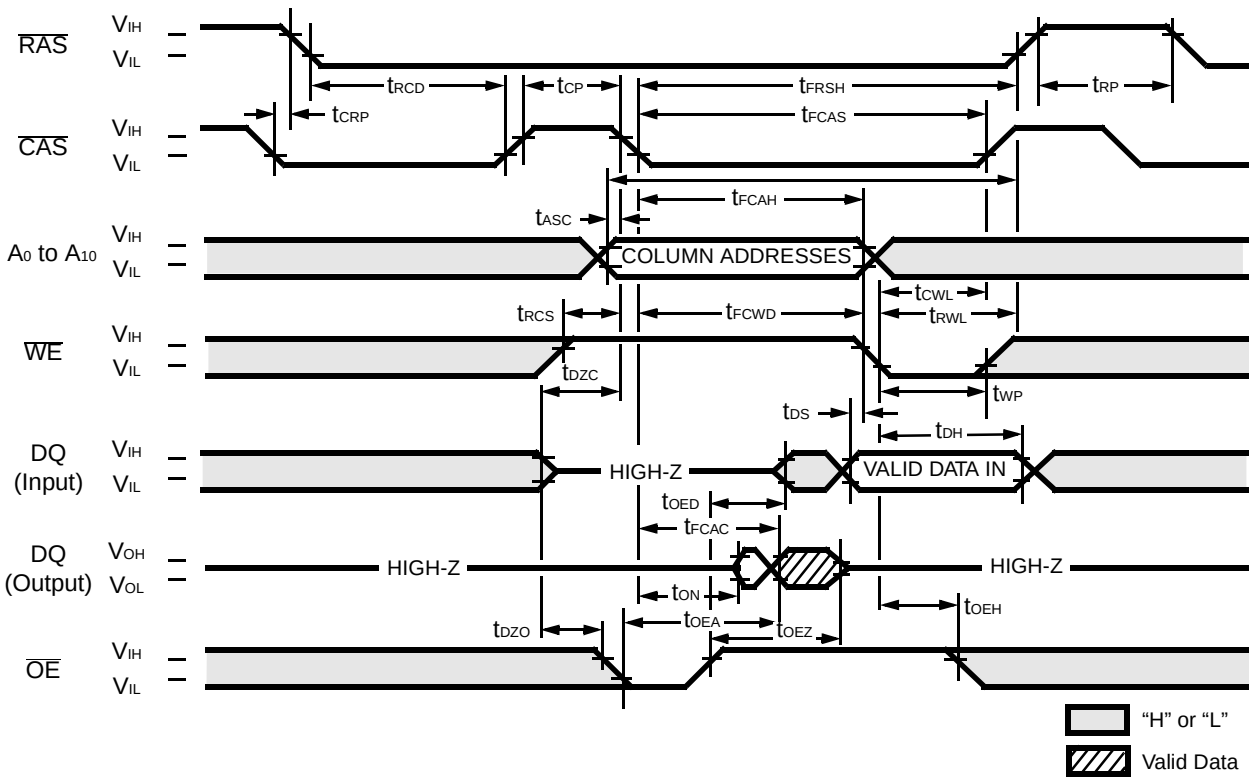
Fig. 15 – HIDDEN REFRESH CYCLE



DESCRIPTION

A hidden refresh cycle may be performed while maintaining the latest valid data at the output by extending the active time of $\overline{CAS}$ and cycling $\overline{RAS}$. The refresh row address is provided by the on-chip refresh address counter. This eliminates the need for the external row address that is required by DRAMs that do not have $\overline{CAS}$-before-$\overline{RAS}$ refresh capability.

Fig. 16 – $\overline{CAS}$-BEFORE-$\overline{RAS}$ REFRESH COUNTER TEST CYCLE



DESCRIPTION

A special timing sequence using the $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test cycle provides a convenient method to verify the function of $\overline{CAS}$-before-$\overline{RAS}$ refresh circuitry. If, a $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle $\overline{CAS}$ makes a transition from High to Low while $\overline{RAS}$ is held Low, read and write operations are enabled as shown above. Row and column addresses are defined as follows:

Row Address: Bits A0 through A10 are defined by the on-chip refresh counter.
Column Address: Bits A0 through A9 are defined by latching levels on A0-A9 at the second falling edge of $\overline{CAS}$.

The $\overline{CAS}$-before-$\overline{RAS}$ Counter Test procedure is as follows ;

1) Initialize the internal refresh address counter by using 8 $\overline{RAS}$-only refresh cycles.
2) Use the same column address throughout the test.
3) Write "0" to all 2048 row addresses at the same column address by using normal write cycles.
4) Read "0" written in procedure 3) and check; simultaneously write "1" to the same addresses by using $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test (read-modify-write cycles). Repeat this procedure 2048 times with addresses generated by the internal refresh address counter.
5) Read and check data written in procedure 4) by using normal read cycle for all 2048 memory locations.
6) Reverse test data and repeat procedures 3), 4), and 5).

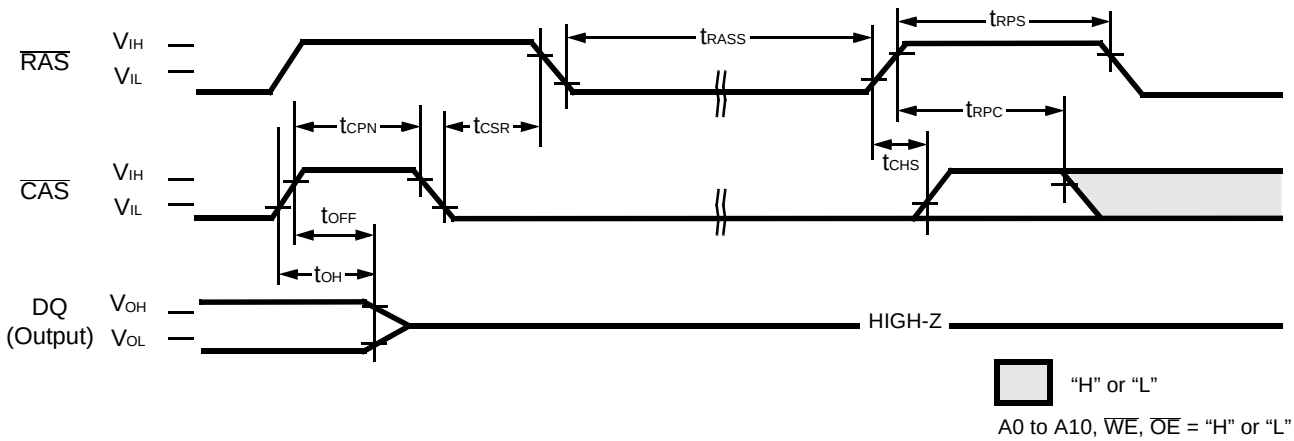
(At recommended operating conditions unless otherwise noted.)

No.	Parameter	Symbol	MB817800A-60		MB817800A-70		Unit
			Min.	Max.	Min.	Max.	
90	Access Time from $\overline{CAS}$	t_{FCAC}	—	50	—	55	ns
91	Column Address Hold Time	t_{FCAH}	35	—	35	—	ns
92	$\overline{CAS}$ to $\overline{WE}$ Delay Time	t_{FCWD}	70	—	77	—	ns
93	$\overline{CAS}$ Pulse Width	t_{FCAS}	90	—	99	—	ns
94	$\overline{RAS}$ Hold Time	t_{FRSH}	90	—	99	—	ns

Note: Assumes that $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test cycle only.

MB8117800A-60/-70

Fig. 17 – SELF REFRESH CYCLE (A0-A10 = $\overline{WE}$ = $\overline{OE}$ = "H" or "L")



(At recommended operating conditions unless otherwise noted.)

No.	Parameter	Symbol	MB817800A-60		MB817800A-70		Unit
			Min.	Max.	Min.	Max.	
100	$\overline{RAS}$ Pulse Width	t_{RASS}	100	—	100	—	µs
101	$\overline{RAS}$ Precharge Time	t_{RPS}	110	—	125	—	ns
102	$\overline{CAS}$ Hold Time	t_{CHS}	–50	—	–50	—	ns

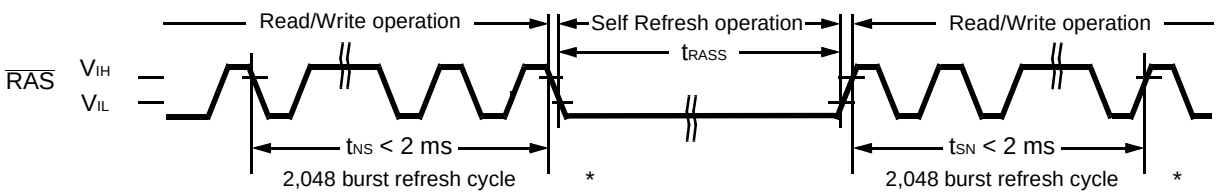
Note: Assumes self refresh cycle only

DESCRIPTION

The self refresh cycle provides a refresh operation without external clock and external Address. Self refresh control circuit on chip is operated in the self refresh cycle and refresh operation can be automatically executed using internal refresh address counter and timing generator. If $\overline{CAS}$ goes to "L" before $\overline{RAS}$ goes to "L" (CBR) and the condition of $\overline{CAS}$ "L" and $\overline{RAS}$ "L" is kept for term of t_{RASS} (more than 100 µs), the device can enter the self refresh cycle. Following that, refresh operation is automatically executed at fixed intervals using internal refresh address counter during "$\overline{RAS}$ = L" and "$\overline{CAS}$ = L".
Exit from self refresh cycle is performed by togging $\overline{RAS}$ and $\overline{CAS}$ to "H" with specified t_{CHS} min.. In this time, $\overline{RAS}$ must be kept "H" with specified t_{RPS} min..
Using self refresh mode, data can be retained without external $\overline{CAS}$ signal during system is in standby.

Restriction for Self Refresh operation;
For self refresh operation, the notice below must be considered.

1) In the case that distributed CBR refresh are operated between read/write cycles
   Self refresh cycles can be executed without special rule if 2,048 cycles of distributed CBR refresh are executed within t_{REF} max..
2) In the case that burst CBR refresh or distributed burst $\overline{RAS}$-only refresh are operated between read/write cycles
   2,048 times of burst CBR refresh or 2,048 times of burst $\overline{RAS}$-only refresh must be executed before and after Self refresh cycles.



* read/write operation can be performed non refresh time within t_{NS} or t_{SN}

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).
CAUTION:
Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
