## ABSOLUTE MAXIMUM RATINGS

| Parameter   | Symbol                             | Value      | Units |
|---|------------------------------------|------------|-------|
| Voltage on any pin relative to V <sub>SS</sub>                | V <sub>IN</sub> , V <sub>OUT</sub> | -1.0 ~ 4.6 | V     |
| Voltage on V <sub>CC</sub> supply relative to V <sub>SS</sub> | V <sub>CC</sub> , V <sub>CCQ</sub> | -1.0 ~ 4.6 | V     |
| Storage Temperature   | T <sub>STG</sub>                   | -55 ~ +150 | °C    |
| Power Dissipation   | P <sub>D</sub>                     | 9          | W     |
| Short Circuit Current   | I <sub>OS</sub>                    | 50         | mA    |

Note: Permanent device damage may occur if "ABSOLUTE MAXIMUM RATINGS" are exceeded.  
Functional operation should be restricted to recommended operating condition.  
Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

- Access times to be measured w/input signals of 1 V/ns edge rate, 0.8 V to 2.0 V, t<sub>CO</sub> is clock to output with no load.
- CL = CAS Latency
- Data Masked on the same clock
- Self refresh Exit is asynchronous, requiring 10 ns to ensure initiation. Self refresh exit is complete in 10 ns + t<sub>RC</sub>.
- Timing is asynchronous. If t<sub>IS</sub> is not met by rising edge of CK then CKE is assumed latched on next cycle.
- If the clock is stopped during self refresh or power down, 200 clocks are required before CKE is high.
