1.4 W Mono Filterless Class D Audio power Amplifier (MSOP / DFN)

—Compatible with LY8890/8891/8891B Single-Ended Input

### **FEATURES**

- 1.4 W Into 8Ω from 5V power supply at THD = 10% (Typ).
- 2.5V~5.5V power supply.
- Low shutdown current.
- Low quiescent current.
- Minimum external components.
- No output filter required for inductive loads.
- Output Pin Short-Circuit Protection (Short to Output Pin, Short to GND, Short to VCC)
- Low noise during turn-on and turn-off transitions.
- Easy upgrade Class AB (LY8990/LY8891) to Class D (Pin to Pin Replace).
- Lead free and green package available. (RoHS Compliant)
- Space Saving Package
  - 8-pin MSOP package.
  - 8-pin DFN package

### **GENERAL DESCRIPTION**

The LY8006 is a high efficiency, 1.4 W mono class D audio power amplifier. It is a low noise, filterless PWM architecture eliminates the output filter, reducing external component count, system cost, and simplify design.

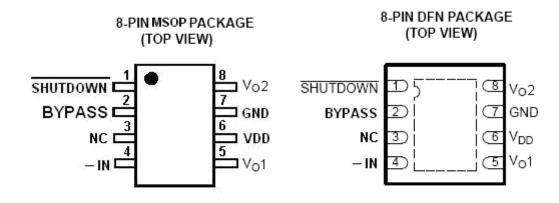

The LY8006 is designed to meet of portable electronic devices. The LY8006 is a single 5V supply, it is capable of driving  $8\Omega$  speaker load at a continuous average output of 1.4 W with 10% THD+N. The LY8006 has high efficiency with speaker loads compared to a typical Class AB amplifier. With a 3.6V supply driving an  $8\Omega$  speaker, the LY8006 efficiency for a 400mW power level is 88%.

In cellular handsets, the earpiece, speaker phone, and melody ringer can each be driven by the LY8006. The gain of the LY8006 is externally configurable which allows independent gain control from multiple sources by summing the signals. Output pin short circuit ( short to output pin, short to ground and short to VDD ) protection prevent the device from damage during fault conditions.

#### **APPLICATION**

- Portable electronic devices
- Mobile Phones
- PDAs

#### APPLICATION INFORMATION

### Input Resistors (Ri) and Gain

The input resistors (Ri) set the gain of the amplifier according to the equation.

Pre-Amplifier Gain =  $(Rf/Ri) \times 2 = [150K\Omega/(5K\Omega + Ri)] \times 2$ 

Total Gain =  $[(Rf / Ri) \times 2] \times 2 = \{[150K\Omega / (5K\Omega + Ri)] \times 2\} \times 2$ 

 $A_{VD} = 20 \times \log \{2 \times [(Rf/Ri) \times 2]\}$ 

The resistor matching is very important in the amplifiers. Balance of the output on the reference voltage depends on matched ratio of the resistors. CMRR, PSRR, and cancellation of the second harmonic distortion if resistor mismatch occurs. Therefore, it is recommended to use 1% tolerance resistors or better to keep the performance optimized. Matching is more important than overall tolerance.

Resistor arrays with 1% matching can be used with a tolerance greater than 1%. Place the input resistors very close to the LY8006 to limit noise injection on the high-impedance nodes. For optimal performance the gain should be set to 2 V/V or lower. Lower gain allows the LY8006 to operate at its best,

#### For example

Table 1. Typical Total Gain and AVD Values

Rf (KΩ)	150	150	150	150	150	150
Ri (KΩ)	300	150	100	75	50	37.5
Pre AMP. Gain	1	2	3	4	6	8
Total Gain	2	4	6	8	12	16
Avd (db)	6.02	12.04	15.56	18.06	21.58	24.08

#### **Input Capacitors (Ci)**

The LY8006 using a single-ended source, So the input coupling capacitors are required. The input capacitors and input resistors form a high-pass filter with the corner frequency(fc), determined in the equation.

$$fc = 1 / (2 \pi Ri Ci)$$

The value of the input capacitor is important to consider as it directly affects the bass (low frequency) performance of the circuit. Speakers in wireless phones cannot usually respond well to low frequencies, so the corner frequency can be set to block low frequencies in this application. Equation is reconfigured to solve for the input coupling capacitance.

 $Ci = 1 / (2 \pi Ri fc)$ 

If the corner frequency is within the audio band, the capacitors should have a tolerance of  $\pm 10\%$  or better, because any mismatch in capacitance causes an impedance mismatch at the corner frequency and below.

Rev. 1.7

1.4 W Mono Filterless Class D Audio power Amplifier (MSOP / DFN)

— Compatible with LY8890/8891/8891B Single-Ended Input

#### For example

In the table 2 shows the external components. Rin in connect with Cin to create a high-pass filter.

**Table 2. Typical Component Values** 

Reference	Description	Note
Ri	150ΚΩ	1% tolerance resistors
Ci	0.22uF	80%/–20%

Ci = 1 / (  $2\pi$  Ri fc)

Ci = 1 / (  $2\pi *150$ K $\Omega *4.8$ Hz)=0.221uF , Use 0.22uF

## **Two Single-Ended Input Signals**

Two resistors and two capacitors are needed for summing single-ended input signals. The gain and corner frequencies (fc1 and fc2) for each input source can be set independently.

Pre-Amplifier Gain 1 =  $[150K\Omega / (5K\Omega + Ri1)] \times 2$ 

Pre-Amplifier Gain 2 =  $[150K\Omega / (5K\Omega + Ri2)] \times 2$ 

Ci1 =  $1/(2\pi Ri1 fc1)$ 

 $Ci2 = 1 / (2 \pi Ri2 fc2)$

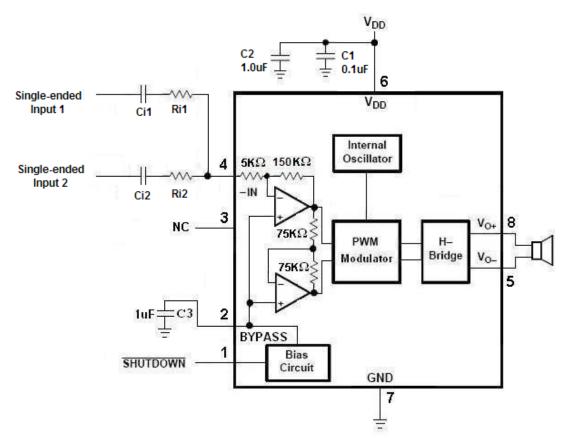

Figure 7. Application Schematic With Two Single-Ended Inputs Configuration

### **PCB Layout**

All the external components must place very close to the LY8006. The input resistors need to be very close to the LY8006 input pins so noise does not couple on the high impedance nodes between the input resistors and the input amplifier of the LY8006. Then place the decoupling capacitor Cs, close to the LY8006 is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

Making the high current traces going to VDD, GND, Vo+ and Vo- pins of the LY8006 should be as wide as possible to minimize trace resistance. If these traces are too thin, the LY8006's performance and output power will decrease. The input traces do not need to be wide, but do need to run side-by-side to enable common-mode noise cancellation.
