CLK	I	Clock Input Pin This pin reads serial data at the rising edge and outputs data at the falling edge	4
STB	I	Serial Interface Strobe Pin The data input after the STB has fallen is processed as a command. When this pin is "High", CLK is ignored.	5

FUNCTION DESCRIPTION

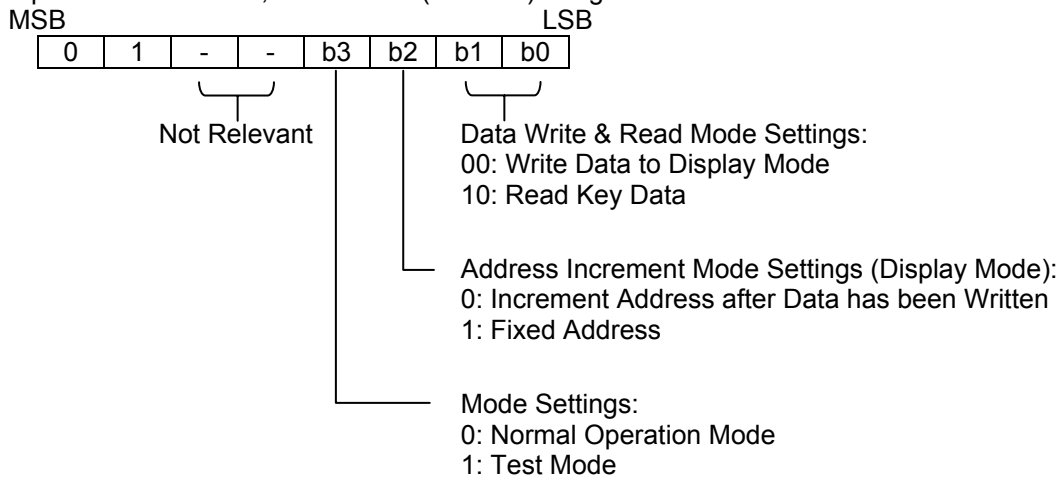

COMMANDS

A command is the first byte (b0 to b7) inputted to PT6958 via the DIN Pin after STB Pin has changed from “HIGH” to “LOW” State. If for some reason the STB Pin is set to “HIGH” while data or commands are being transmitted, the serial communication is initialized, and the data/commands being transmitted are considered invalid.

COMMAND 1: DATA SETTING COMMANDS

The Data Setting Commands executes the Data Write or Data Read Modes for PT6958. The data Setting Command, the bits 5 and 6 (b4, b5) are ignored, bit 7 (b6) is given the value of “1” while bit 8 (b7) is given the value of “0”. Please refer to the diagram below.

When power is turned ON, bit 4 to bit 1 (b3 to b0) are given the value of “0”.

PT6958 KEY MATRIX & KEY INPUT DATA STORAGE RAM

PT6958 Key Matrix consists of 6 x 4 array as shown below:

Each data entered by each key is stored as follows and read by a READ Command, starting from the last significant bit. When the most significant bit of the data (SG6, b7) has been read, the least significant bit of the next data (SG1, b0) is read.

COMMAND 2: ADDRESS SETTING COMMANDS

Address Setting Commands are used to set the address of the display memory. The address is considered valid if it has a value of "00H" to 09H". If the address is set to 0AH or higher, the data is ignored until a valid address is set. When power is turned ON, the address is set at "00H".

Please refer to the diagram below.

DISPLAY MODE AND RAM ADDRESS

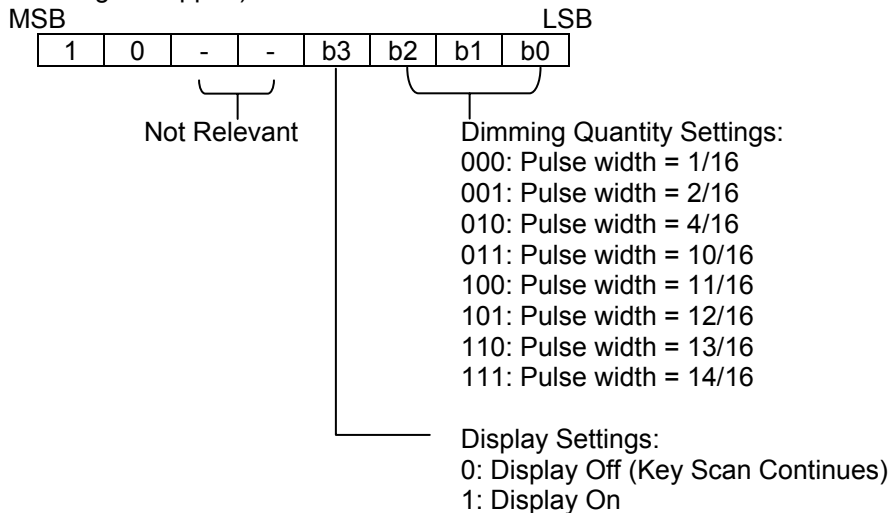

Data transmitted from an external device to PT6958 via the serial interface are stored in the Display RAM and are assigned addresses. The RAM Addresses of PT6958 are given below in 8 bits unit.

SG1	SG4	SG5	SG8	SG9	SG10	
00HL		00HU		01HL		DIG1
02HL		02HU		03HL		DIG2
04HL		04HU		05HL		DIG3
06HL		06HU		07HL		DIG4
08HL		08HU		09HL		DIG5

COMMAND 3: DISPLAY CONTROL COMMANDS

The Display Control Commands are used to turn ON or OFF a display. It also used to set the pulse width. Please refer to the diagram below. When the power is turned ON, a 1/16 pulse width is selected and the displayed is turned OFF (the key scanning is stopped).

SCANNING AND DISPLAY TIMING

The Key Scanning and Display Timing diagram is given below. One cycle of key scanning consists of 1 frame. The data of the are 6 x 4 matrix is stored in the RAM.

SERIAL COMMUNICATION FORMAT

The following diagram shows the PT6958 serial communication format. The DOUT Pin is an N-channel, open-drain output pin, therefore, it is highly recommended that an external pull-up resistor (1 KΩ to 10 KΩ) must be connected to DOUT.

Reception (Data/Command Write)

Transmission (Data Read)

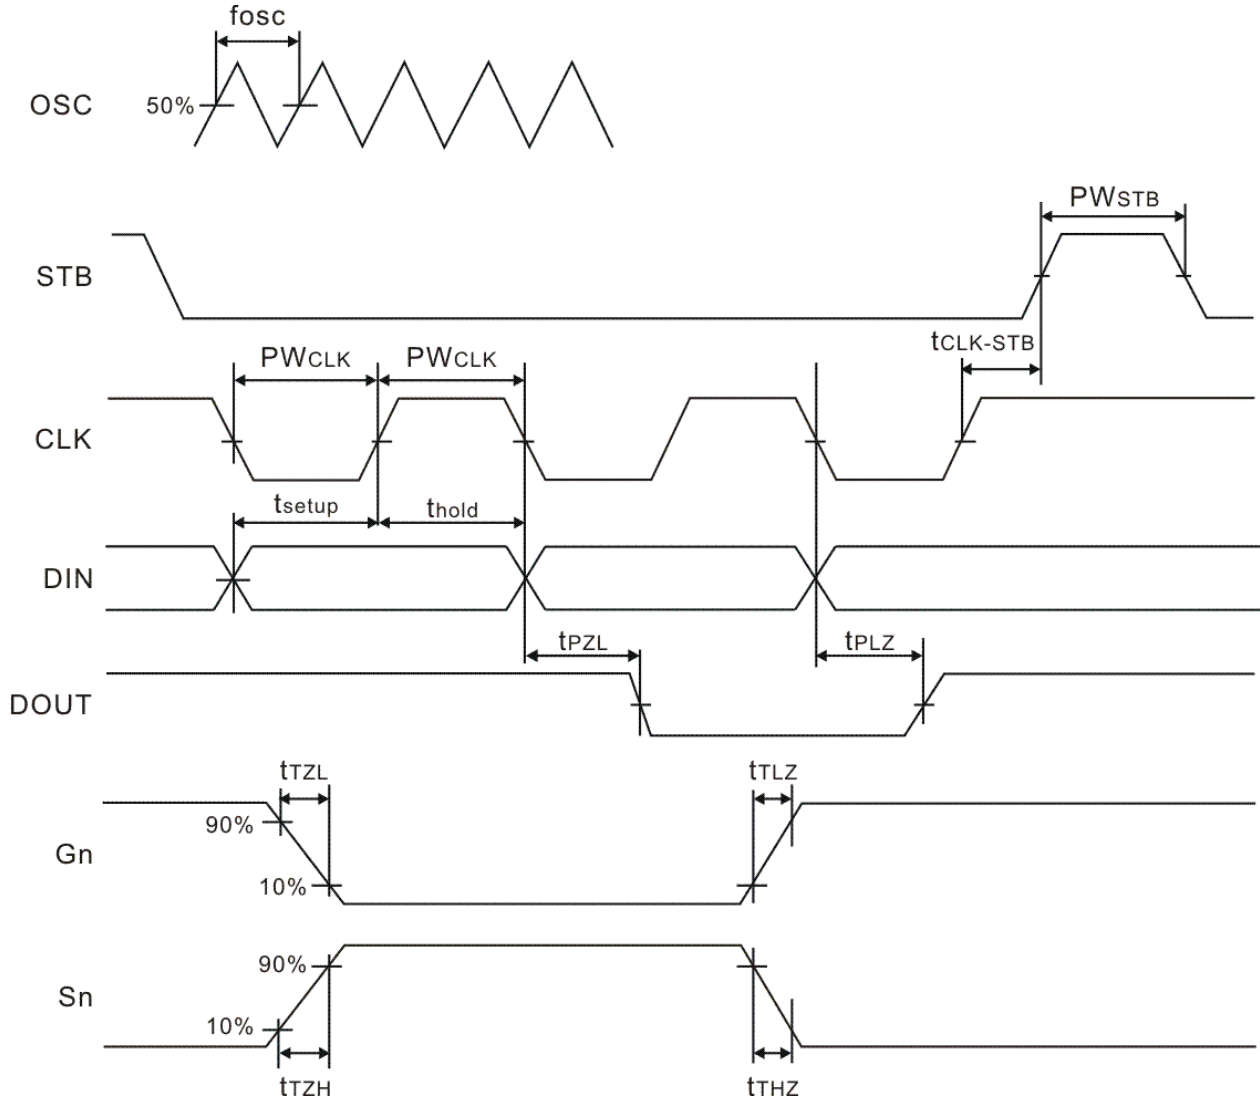

where: t_{wait} (waiting time) $\geq 1 \mu s$

It must be noted that when the data is read, the waiting time (t_{wait}) between the rising of the eighth clock that has set the command and the falling of the first clock that has read the data is greater or equal to 1 μs .

SWITCHING CHARACTERISTIC WAVEFORM

PT6958 Switching Characteristics Waveform is given below.

where:

f_{osc} = Oscillation Frequency

PW_{STB} (Strobe Pulse Width) $\geq 1 \mu s$

APPLICATIONS

Display memory is updated by incrementing addresses. Please refer to the following diagram.

RECOMMENDED SOFTWARE FLOWCHART

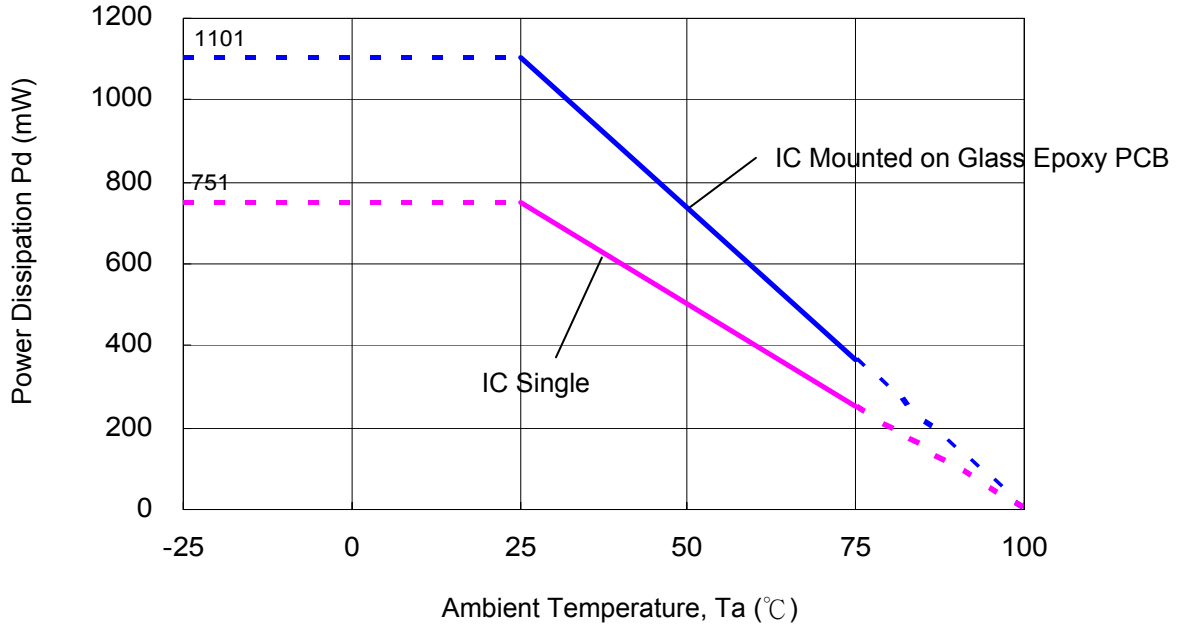

Notes:

1. Command 1: Data Setting Commands.
2. Command 2: Address Setting Commands.
3. Command 3: Display Control Commands.
4. When IC power is applied for the first time, the contents of the Display RAM are not defined; thus, it is strongly suggested that the contents of the Display RAM must be cleared during the initial setting.
