
HM65W8512 Series

4 M PSRAM (512-kword × 8-bit)
2 k Refresh

HITACHI

ADE-203-289C(Z)

Rev. 3.0

Nov. 1997

Description

The Hitachi HM65W8512 is a CMOS pseudo static RAM organized 512-kword × 8bit. It realizes higher density, higher performance and low power consumption by employing 0.8 μm Hi-CMOS process technology.

It offers low power data retention by self refresh mode. It also offers easy non multiplexed address interface and easy refresh functions. HM65W8512 is suitable for handy systems which work with battery back-up systems.

The device is packaged in a small 525-mil SOP (460-mil body SOP) or a 400 mil TSOP TYPE II.

Features

- Single 3.3 V (±0.3V)
- High speed
 - Access time
CE access time: 120/150 ns (max)
 - Cycle time
Random read/write cycle time:
190/230 ns (min)
- Low power
 - Active: 100 mW (typ)
 - Standby: 85 μW (typ)
- Directly TTL/CMOS compatible
All inputs and outputs
- Simple address configuration
Non multiplexed address
- Refresh cycle
 - 2048 refresh cycles: 32 ms

HM65W8512 Series

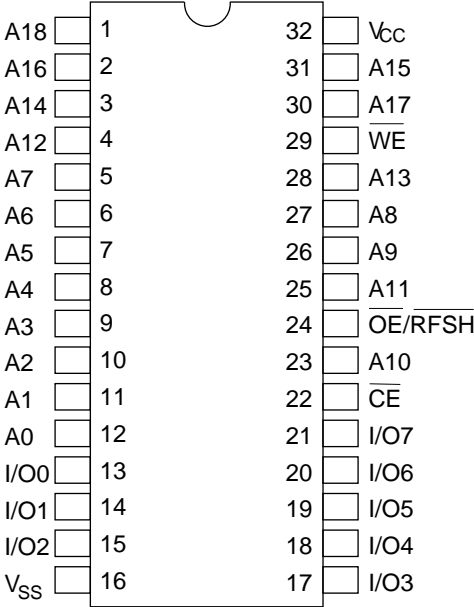

- Easy refresh functions
 - Address refresh
 - Automatic refresh
 - Self refresh

Ordering Information

Pin Arrangement (cont.)

Pin Description

Pin name	Function
A0 to A18	Address
I/O0 to I/O7	Input/ output
CE	Chip enable
$\overline{\text{OE/RFSH}}$	Output enable/Refresh
$\overline{\text{WE}}$	Write enable
V _{CC}	Power supply
V _{SS}	Ground

Block Diagram

Pin Functions

\overline{CE} : Chip Enable (Input)

\overline{CE} is a basic clock. RAM is active when \overline{CE} is low, and is on standby when \overline{CE} is high.

A0 to A18: Address Inputs (Input)

A0 to A10 are row addresses and A11 to A18 are column addresses. The entire addresses A0 to A18 are fetched into RAM by the falling edge of \overline{CE} .

$\overline{OE}/\overline{RFSH}$: Output Enable/Refresh (Input)

This pin has two functions. Basically it works as \overline{OE} when \overline{CE} is low, and as \overline{RFSH} when \overline{CE} is high (in standby mode). After a read or write cycle finishes, refresh does not start if \overline{CE} goes high while $\overline{OE}/\overline{RFSH}$ is held low. In order to start a refresh in standby mode, $\overline{OE}/\overline{RFSH}$ must go high to reset the refresh circuits of the RAM. After the refresh circuits are reset, the refresh starts when $\overline{OE}/\overline{RFSH}$ goes low.

I/O0 to I/O7: Input/Output (Inputs and Outputs) These pins are data I/O pins.

HM65W8512 Series

$\overline{\text{WE}}$: Write Enable (Input)

RAM is in write mode when $\overline{\text{WE}}$ is low, and is in read mode when $\overline{\text{WE}}$ is high. I/O data is fetched into RAM by the rising edge of $\overline{\text{WE}}$ or $\overline{\text{CE}}$ (earlier timing) and the data is written into memory cells.

Refresh

There are three refresh modes : address refresh, automatic refresh and self refresh.

- (1) Address refresh: Data is refreshed by accessing all 2048 row addresses every 32 ms. A read is one method of accessing those addresses. Each row address (2048 addresses of A0 to A10) must be read at least once every 32 ms. In address refresh mode, $\overline{\text{OE/RFSH}}$ can remain high. In this case, the I/O pins remain at high impedance, but the refresh is done within RAM.
- (2) Automatic refresh: Instead of address refresh, automatic refresh can be used. RAM goes to automatic refresh mode if $\overline{\text{OE/RFSH}}$ falls while $\overline{\text{CE}}$ is high and it remains low for at least t_{FAP} . One automatic refresh cycle is executed by one low pulse of $\overline{\text{OE/RFSH}}$. It is not necessary to input the refresh address from outside since it is generated internally by an on-chip address counter. 2048 automatic refresh cycles must be done every 32 ms.
- (3) Self refresh: Self refresh mode is suitable for data retention by battery. In standby mode, a self refresh starts automatically when $\overline{\text{OE/RFSH}}$ stays low for more than 8 μs . Refresh addresses are automatically specified by the on-chip address counter, and the refresh period is determined by the on-chip timer.

Automatic refresh and self refresh are distinguished from each other by the width of the $\overline{\text{OE/RFSH}}$ low pulse in standby mode. If the $\overline{\text{OE/RFSH}}$ low pulse is wider than 8 μs , RAM becomes into self refresh mode; if the $\overline{\text{OE/RFSH}}$ low pulse is less than 8 μs , it is recognized as an automatic refresh instruction.

At the end of self refresh, refresh reset time (t_{RFS}) is required to reset the internal self refresh operation of the RAM. During t_{RFS} , $\overline{\text{CE}}$ and $\overline{\text{OE/RFSH}}$ must be kept high. If auto refresh follows self refresh, low transition of $\overline{\text{OE/RFSH}}$ at the beginning of automatic refresh must not occur during t_{RFS} period.

Notes on Using the HM65W8512

Since pseudo static RAM consists of dynamic circuits like DRAM, its clock pins are more noise-sensitive than conventional SRAM's.

- (1) If a short $\overline{\text{CE}}$ pulse of a width less than $t_{\text{CE min}}$ is applied to RAM, an incomplete read occurs and stored data may be destroyed. Make sure that $\overline{\text{CE}}$ low pulses of less than $t_{\text{CE min}}$ are inhibited. Note that a 10 ns $\overline{\text{CE}}$ low pulse may sometimes occur owing to the gate delay on the board if the $\overline{\text{CE}}$ signal is generated by the decoding of higher address signals on the board. Avoid these short pulses.
- (2) $\overline{\text{OE/RFSH}}$ works as refresh control in standby mode. A short $\overline{\text{OE/RFSH}}$ low pulse may cause an incomplete refresh that will destroy data. Make sure that $\overline{\text{OE/RFSH}}$ low pulse of less than $t_{\text{FAP min}}$ are also inhibited.
- (3) t_{OHC} and t_{OCD} are the timing specs which distinguish the $\overline{\text{OE}}$ function of $\overline{\text{OE/RFSH}}$ from the $\overline{\text{RFSH}}$ function. The t_{OHC} and t_{OCD} specs must be strictly maintained.

- (4) Start the HM65W8512 operating by executing at least eight initial cycles (dummy cycles) at least 100 μ s after the power voltage reaches 3.0 V-3.6 V after power-on.

Function Table

$\overline{\text{CE}}$	$\overline{\text{OE/RFSH}}$	$\overline{\text{WE}}$	I/O pin	Mode
L	L	H	Dout	Read
L	X	L	High-Z	Write
L	H	H	High-Z	—
H	L	X	High-Z	Refresh
H	H	X	High-Z	Standby

Note: X means H or L.

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Terminal voltage with respect to V_{SS}	V_T	-0.5 to +6.0	V
Power dissipation	P_T	1.0	W
Operating temperature	T_{opr}	0 to +70	$^{\circ}\text{C}$

HM65W8512 Series

AC Characteristics

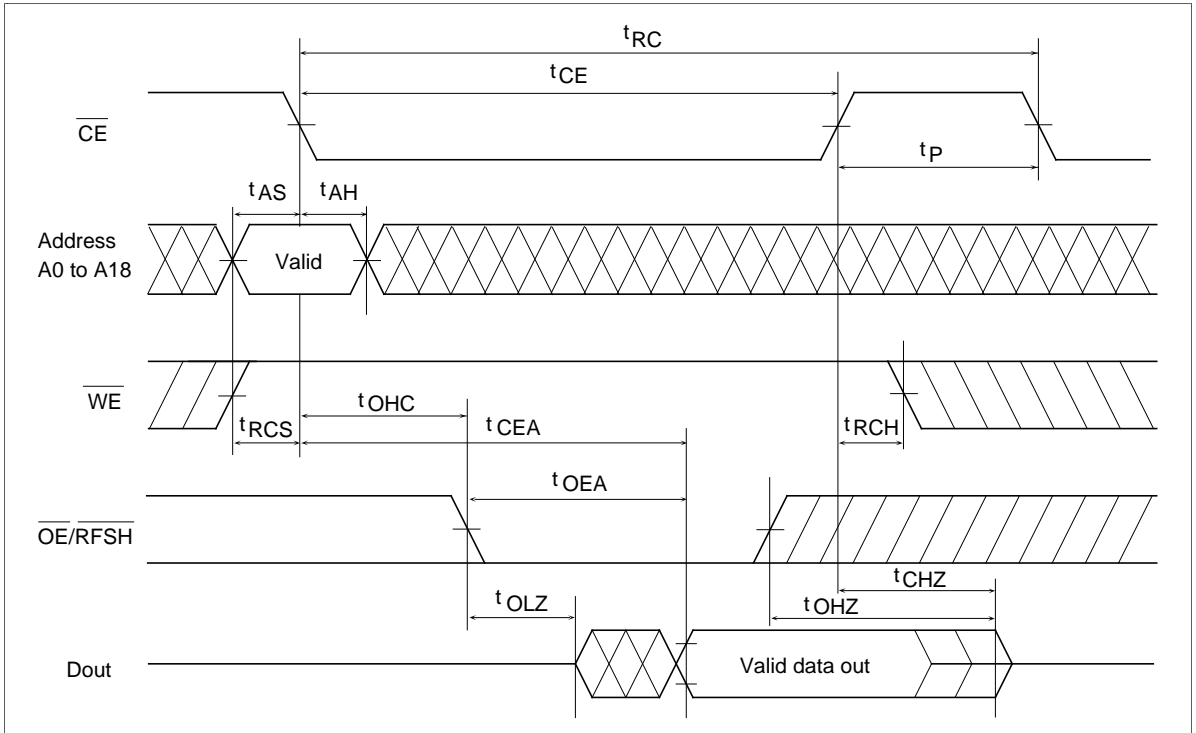

($T_a = 0$ to $+70^\circ\text{C}$, $V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, unless otherwise noted.) (cont.)

Parameter	Symbol	HM65W8512-12		HM65W8512-15		Unit	Notes
		Min	Max	Min	Max		
Data in to end of write	t_{DW}	30	—	30	—	ns	
Data in hold time for write	t_{DH}	0	—	0	—	ns	
Output active from end of write	t_{OW}	5	—	5	—	ns	2
Write to output in high-Z	t_{WHZ}	—	30	—	30	ns	1, 2
Transition time (rise and fall)	t_T	3	50	3	50	ns	6
Refresh command delay time	t_{RFD}	70	—	80	—	ns	
Refresh precharge time	t_{FP}	40	—	40	—	ns	
Refresh command pulse width for automatic refresh	t_{FAP}	80	8000	80	8000	ns	
Automatic refresh cycle time	t_{FC}	190	—	230	—	ns	
Refresh command pulse width for self refresh	t_{FAS}	8	—	8	—	μs	
Refresh reset time from self refresh	t_{RFS}	600	—	600	—	ns	9
Refresh period	t_{REF}	—	32	—	32	ms	2048 cycle

- Notes:
- t_{CHZ} , t_{OHZ} , t_{WHZ} are defined as the time at which the output achieves the open circuit condition.
 - t_{CHZ} , t_{CLZ} , t_{OHZ} , t_{OLZ} , t_{WHZ} and t_{OW} are sampled under the condition of $t_T = 5 \text{ ns}$ and not 100% tested.
 - A write occurs during the overlap of low \overline{CE} and low \overline{WE} . Write end is defined at the earlier of \overline{WE} going high or \overline{CE} going high.
 - If the \overline{CE} low transition occurs simultaneously with or from the \overline{WE} low transition, the output buffers remain in high impedance state.
 - In write cycle, \overline{OE} or \overline{WE} must disable output buffers prior to applying data to the device and at the end of write cycle data inputs must be floated prior to \overline{OE} or \overline{WE} turning on output buffers. During this period, I/O pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.
 - Transition time t_T is measured between V_{IH} (min) and V_{IL} (max). V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals.
 - After power-up, pause for more than $100 \mu\text{s}$ and execute at least 8 initialization cycles.
 - 2048 cycles of burst refresh or the first cycle of distributed automatic refresh must be executed within $15 \mu\text{s}$ after self refresh, in order to meet the refresh specification of 32 ms and 2048 cycles.
 - At the end of self refresh, refresh reset time (t_{RFS}) is required to reset the internal self refresh operation of the RAM. During t_{RFS} , \overline{CE} and $\overline{OE/RFSH}$ must be kept high. If automatic refresh follows self refresh, low transition of $\overline{OE/RFSH}$ at the beginning of automatic refresh must not occur during t_{RFS} period.
