

GMLM317L

100mA ADJUSTABLE VOLTAGE REGULATOR

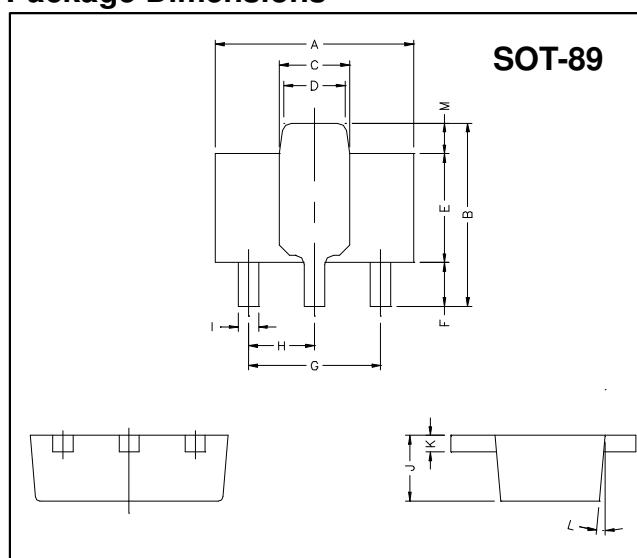

Description

The GMLM317L is a monolithic integral circuit, designed for use as positive adjustable voltage regulator. It is designed to supply unit 100mA of load current with an output voltage adjustable over a 1.25V to 37V range.

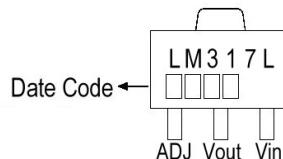

Features

- Output voltage adjustable from 1.25V to 37V
- Output current in excess of 100mA
- Thermal overload protection
- Short circuit protection
- Output transistor save area compensation
- Floating operation for high voltage applications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Ratings	Unit
Input-Output Voltage Difference	$V_{IN} - V_{OUT}$	40	V
Power Dissipation	P_D	625	mW
Junction Temperature	T_J	+125	$^\circ\text{C}$
Operating Junction Temperature	T_{OPR}	0 ~ +70	$^\circ\text{C}$
Storage Temperature Range	T_{STR}	-40 ~ +150	$^\circ\text{C}$

Note 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. The device is guaranteed to meet performance specification within $0^\circ\text{C} \sim 70^\circ\text{C}$ operating temperature range and assured by design from $-20^\circ\text{C} \sim 85^\circ\text{C}$.

Application Information and Circuits

The GMLM317L provides an internal reference voltage of 1.25V between the output and adjustments terminals. This is used to set a constant current flow across an external resistor driver, giving an output voltage V_{OUT} of:

$$V_{OUT} = V_{REF} * (1 + R_2 / R_1) + I_{ADJ} * R_2$$

The device is designed to minimize the term I_{ADJ} (100uA max) and to maintain it very constant with line and load changes. Usually, the error term I_{ADJ}*R₂ can be neglected. To obtain the previous requirement, all the regulator quiescent current is returned to the output terminal, imposing a minimum load current condition. If the load is insufficient, the output voltage will rise. The GMLM317L is a floating regulator, input-output differential voltage, supplies of very high voltage with respect to ground can be regulated as long as the maximum input-output differential is not exceeded. Furthermore, programmable regulators are easily obtainable and, by connecting a fixed resistor between the adjustment and output, the device can be used as a precision current regulator.
