DESCRIPTION

The M74HC4022 is an high speed CMOS OCTAL COUNTER/DIVIDER fabricated with silicon gate C²MOS technology.

It contains a 4-stage divide-by-8 Johnson counter with 8 decoded outputs (Q0 - Q7) and a Carry-out bit. This counter is advanced on the positive edge of the clock signal when \overline{CE} input is held low, or is advanced on the negative edge of clock enable

signal when CLOCK input is held high, and the selected one of eight outputs goes high. Holding the CLEAR input high clears the counter to zero regardless of the other input conditions. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(\text{opr})} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}$
