

CURRENT MODE PWM CONTROLLER

LM3842A/3A/4A/5A

FEATURES

- Automatic feed forward compensation
- Optimized for offline converter
- Double pulse suppression
- Current mode operation to 500 KHz
- High gain totem pole output
- Internally trimmed bandgap reference
- Undervoltage lockout with hysteresis
- Low start up current : < 0.3 mA
- Moisture Sensitivity Level 3

DESCRIPTION

The LM384xA are fixed frequency current-mode PWM controller. They are specially designed for Off-Line and DC-to-DC converter applications with minimal external components.

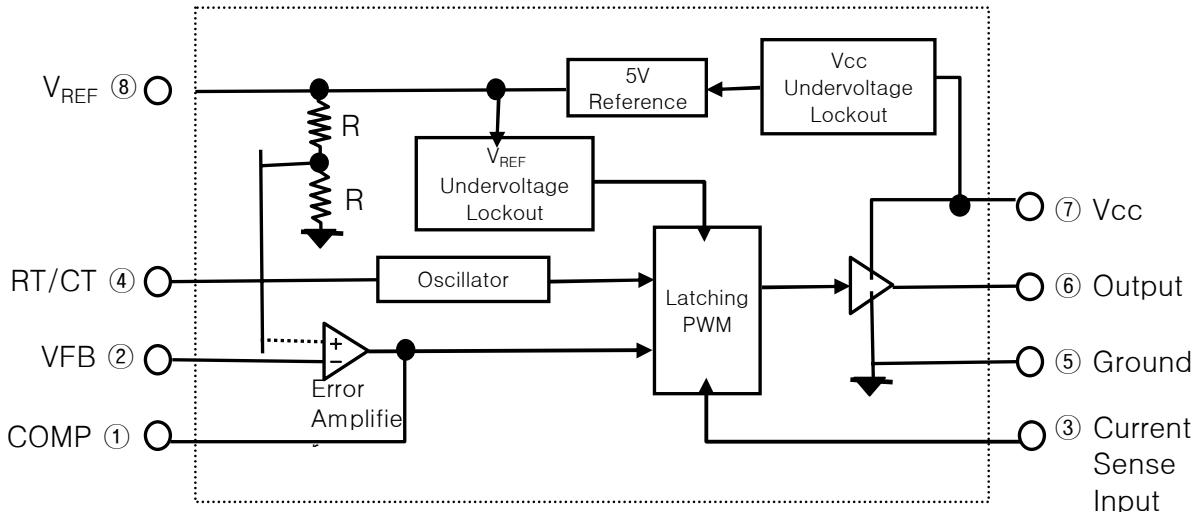

These integrated circuits features a trimmed oscillator for precise duty cycle control, a temperature compensated reference, high gain error amplifier, current sensing comparator, and a high current totempole output ideally suited for driving a power MOSFET.

Protection circuitry includes built in under-voltage lockout and current limiting.

Note: 1. Adjust V_{CC} above the start threshold before setting at 15V.

2. Parameter measured at trip point of latch with V_{FB} = 0.

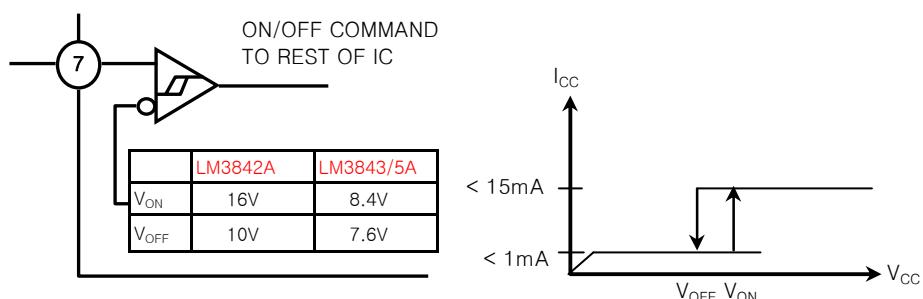

3. Comparator Gain defined as: $A = \frac{\Delta V \text{ Output Compensation(pin FB)}}{\Delta V \text{ Current Sanseinput(pin CS)}} ;$

Fig.1 Open Loop Test Circuit

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5kΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

Fig.2 Under Voltage Lockout

During Under-Voltage Lock-Out, the output driver is biased to a high impedance state.

Pin 6 should be shunted to ground with a bleeder resistor to prevent activating the power switch with output leakage current.

Fig.3 Error Amp Configuration

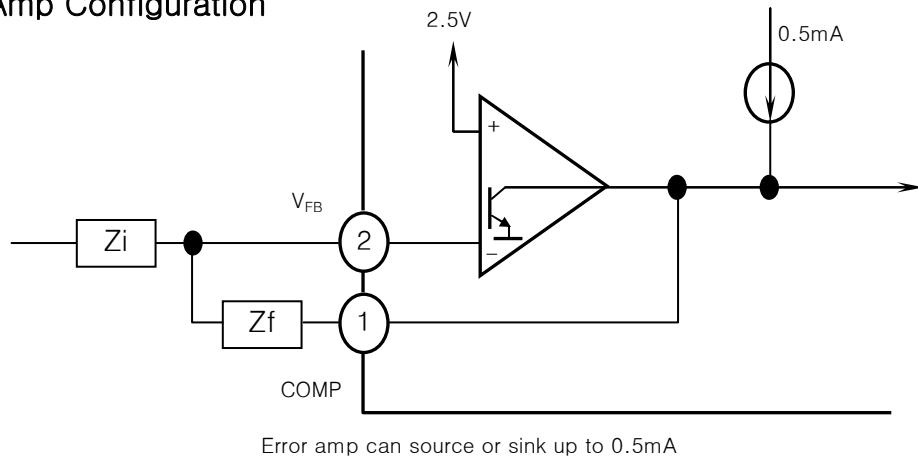

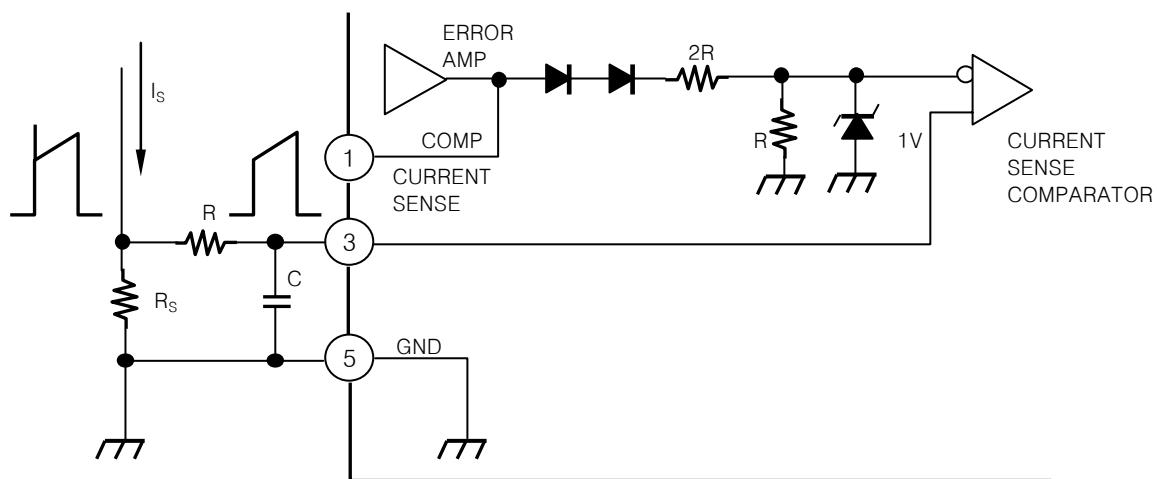

Fig.4 Current Sense Circuit

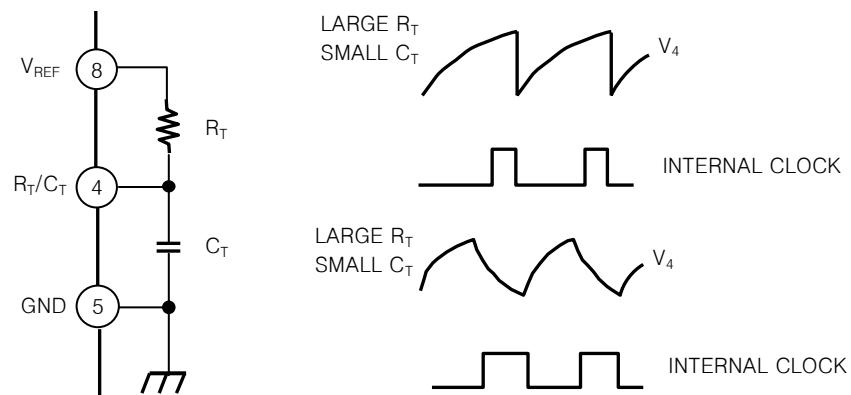

Peak current (I_s) is determined by the formula:

$$I_{s(\text{MAX})} \sim \frac{1.0\text{V}}{R_s}$$

A small RC filter may be required to suppress switch transients.

duty cycle. Charge and discharge times are determined by the formulas:
 $t_c \sim 0.55 R_T C_T$

$$t_d \sim R_T C_T \ln\left(\frac{0.0063 R_T - 2.7}{0.0063 R_T - 4}\right)$$

Frequency, then, is: $f = (t_c + t_d) - 1$

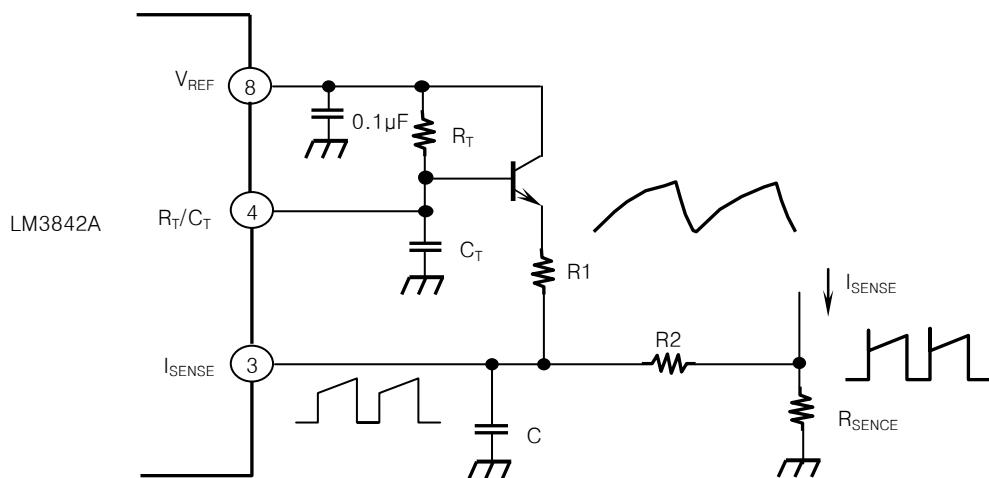

$$\text{For } R_T > 5K\Omega, f \approx \frac{1.8}{R_T C_T}$$

Fig.6 Shutdown Techniques

Shutdown of the LM3842A can be accomplished by two methods; either raise pin 3 above 1V or pull pin 1 below a voltage two diode drops above ground. Either method causes the output of the PWM comparator to be high (refer to block diagram). The PWM latch is reset dominant so that the output will remain low until the next clock cycle after the shutdown condition at pins 1 and/or 3 is removed. In one example, an externally latched shutdown may be accomplished by adding an SCR which will be reset by cycling VCC below the lower UVLO threshold. At this point the reference turns off, allowing the SCR to reset.

Fig.7 Slope Compensation

HTC

CURRENT MODE PWM CONTROLLER

LM3842A/3A/4A/5A

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converters requiring duty cycles over 50%.

Note that capacitor, C, forms a filter with R_T to suppress the leading edge switch spikes.

PIN FUNCTION DESCRIPTION

Pin No.	Function	Description
1	Compensation	This pin is the Error Amplifier output and is made available for loop compensation.
2	Voltage Feedback	This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	Current Sense	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	R _T /C _T	The Oscillator frequency and maximum Output duty cycle are programmed by connecting resistor R _T to VR _{EF} and capacitor C _T to ground. Operation to 500kHz is possible.
5	GND	This pin is the combined control circuitry and power ground.
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1.0A are sourced and sunk by this pin.
7	V _{cc}	This pin is the positive supply of the control IC.
8	V _{REF}	This is the reference output. It provides charging current for capacitor C _T through resistor R _T .
