

0.8% LOW VOLTAGE DETECTOR WITH OUTPUT DELAY

NO.EA-161-110106

OUTLINE

The R3116x series are CMOS-based voltage detector ICs with high detector threshold accuracy and ultra-low supply current, which can be operated at an extremely low voltage and is used for system reset as an example.

Each of these ICs consists of a voltage reference unit, a comparator, resistors for detector threshold setting, an output driver, a hysteresis circuit and an output delay circuit. The detector threshold is internally fixed with high accuracy and does not require any adjustment.

Two output types, Nch open drain type and CMOS type are available.

The R3116x series are operable at a lower voltage than that of the R3112x series, and can be driven by a single battery.

Three types of packages, SOT-23-5, SC-82AB, and DFN(PLP)1010-4 are available.

FEATURES

- Supply Current Typ. $0.35\mu A$ ($-V_{DET}=1.5V$, $V_{DD}=-V_{DET}+1V$)
- Operating Voltage Range 0.5V to 6.0V ($T_{opt}=25^{\circ}C$)
- Detector Threshold Range 0.7V to 5.0V (0.1V steps)
(For other voltages, please refer to MARK INFORMATIONS.)
- Detector Threshold Accuracy $\pm 0.8\%$ ($-V_{DET} \geq 1.5V$)
- Temperature-Drift Coefficient of Detector Threshold Typ. $\pm 30ppm/{\circ}C$
- Built-in Output Delay Circuit Typ. 100ms with an external capacitor: $0.022\mu F$
- Output Delay Time Accuracy $\pm 15\%$ ($-V_{DET} \geq 1.5V$)
- Output Types Nch Open Drain "L" and CMOS
- Packages DFN(PLP)1010-4, SC-82AB, SOT-23-5

APPLICATIONS

- CPU and Logic Circuit Reset
- Battery Checker
- Window Comparator
- Wave Shaping Circuit
- Battery Back-up Circuit
- Power Failure Detector

BLOCK DIAGRAMS

SELECTION GUIDE

The package type, the detector threshold, the output type and the taping type for the ICs can be selected at the users' request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R3116Kxx1*-TR	DFN(PLP)1010-4	10,000 pcs	Yes	Yes
R3116Qxx1*-TR-FE	SC-82AB	3,000 pcs	Yes	Yes
R3116Nxx1*-TR-FE	SOT-23-5	3,000 pcs	Yes	Yes

xx: The detector threshold can be designated in the range from 0.7V(07) to 5.0V(50) in 0.1V steps.
(For other voltages, please refer to MARK INFORMATIONS.)

* : Designation of Output Type
(A) Nch Open Drain
(C) CMOS

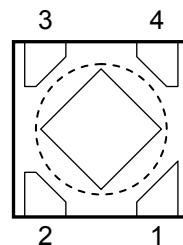

PIN CONFIGURATIONS

PIN DESCRIPTIONS

• DFN(PLP)1010-4*

Pin No.	Symbol	Description
1	OUT	Output Pin ("L" at detection)
2	C _D	Pin for External Capacitor (for setting output delay)
3	GND	Ground Pin
4	V _{DD}	Input Pin

*) Tab is GND level. (They are connected to the reverse side of this IC.)

The tab is better to be connected to the GND, but leaving it open is also acceptable.

• SOT-23-5

Pin No.	Symbol	Description
1	OUT	Output Pin ("L" at detection)
2	V _{DD}	Input Pin
3	GND	Ground Pin
4	NC	No Connection
5	C _D	Pin for External Capacitor (for setting output delay)

• SC-82AB

Pin No.	Symbol	Description
1	V _{DD}	Input Pin
2	GND	Ground Pin
3	C _D	Pin for External Capacitor (for setting output delay)
4	OUT	Output Pin ("L" at detection)

ABSOLUTE MAXIMUM RATINGS

Symbol	Item	Rating	Unit
V_{DD}	Supply Voltage	7.0	V
V_{OUT}	Output Voltage (Nch Open Drain Output)	$V_{SS}-0.3$ to 7.0	V
	Output Voltage (CMOS Output)	$V_{SS}-0.3$ to $V_{DD}+0.3$	
I_{OUT}	Output Current	20	mA
P_D	Power Dissipation (SOT-23-5)*	420	mW
	Power Dissipation (SC-82AB)*	380	
	Power Dissipation (DFN(PLP)1010-4)*	400	
T_{opt}	Operating Temperature Range	-40 to 85	°C
T_{stg}	Storage Temperature Range	-55 to 125	°C

*) For Power Dissipation, please refer to PACKAGE INFORMATION.

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field.

The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

ELECTRICAL CHARACTERISTICS

TIMING CHART

• Output Delay Time

Output Delay Time (t_D) can be calculated with the next formula using the external capacitor:

$$t_D(s) = 4.5 \times 10^6 \times C_D(F)$$

DEFINITION OF OUTPUT DELAY TIME

Output Delay Time (t_D) is defined as follows:

1. In the case of Nch Open Drain Output:

Under the condition of the output pin (OUT) is pulled up through a resistor of $470k\Omega$ to 5V, the time interval between the rising edge of V_{DD} pulse from $(-V_{DET})-0.1V$ to $(-V_{DET})\times 1.1V$ pulse voltage is supplied, the becoming of the output voltage to 2.5V.

2. In the case of CMOS Output:

The time interval between the rising edge of V_{DD} pulse from $(-V_{DET})-0.1V$ to $(-V_{DET})\times 1.1V$ pulse voltage is supplied, the becoming of the output voltage to $((-V_{DET})\times 1.1V)/2$.

When the supply voltage, which is higher than released voltage, is forced to V_{DD} pin, charge to an external capacitor starts, then C_D pin voltage increases. Until the C_D pin voltage reaches to C_D pin threshold voltage, output voltage maintains "L". When the C_D pin voltage becomes higher than C_D pin threshold voltage, output voltage is reversed from "L" to "H". Where the time interval between the rising edge of supply voltage and output voltage reverse point means output delay time.

When the output voltage reverses from "L" to "H", the external capacitor starts to discharge. Therefore, when lower voltage than the detector threshold voltage is forced to V_{DD} pin, the output voltage reverses from "H" to "L" thus the detect delay time is constant not being affected by the external capacitor.

ELECTRICAL CHARACTERISTICS BY DETECTOR THRESHOLD

- R3116x071A/C to R3116x501A/C

Bold values are checked and guaranteed by design engineering at $-40^{\circ}\text{C} \leq \text{T}_{\text{opt}} \leq 85^{\circ}\text{C}$, unless otherwise noted.

$\text{T}_{\text{opt}}=25^{\circ}\text{C}$

									*Note2	75	135

*Note2) 1. In the case of CMOS output type:

When the voltage is forced from $(-V_{DET}) - 0.1V$ to $(-V_{DET}) \times 1.1V$ pulse voltage is added to V_{DD} , time interval that the output voltage reaches $((-V_{DET}) \times 1.1V)/2$.

2. In the case of Nch Open Drain output type:

The output pin is pulled up to 5.0V through 470k Ω , and when the voltage is forced from $(-V_{DET}) - 0.1V$ to $(-V_{DET}) \times 1.1V$ pulse voltage is added to V_{DD} , time interval that the output voltage reaches 2.5V.

OPERATION

- Operation of R3116xxx1A

Block Diagram (R3116xxx1A)

Step	1	2	3	4	5
Comparator (-) Pin Input Voltage	I	II	II	II	I
Comparator Output	L	H	Indefinite	H	L
Tr.1	OFF	ON	Indefinite	ON	OFF
Output Tr. Nch	OFF	ON	Indefinite	ON	OFF

Operation Diagram

- Explanation of operation

- Step 1. The output voltage is equal to the pull-up voltage.
- Step 2. At Point "A", $V_{ref} \geq V_{DD} \times (R_b + R_c) / (R_a + R_b + R_c)$ is true, as a result, the output of comparator is reversed from "L" to "H", therefore the output voltage becomes the GND level. The voltage level of Point A means a detector threshold voltage ($-V_{DET}$).
- Step 3. When the supply voltage is lower than the minimum operating voltage, the operation of the output transistor becomes indefinite. The output voltage is equal to the pull-up voltage.
- Step 4. The output voltage is equal to the GND level.
- Step 5. At Point "B", $V_{ref} \leq V_{DD} \times R_b / (R_a + R_b)$ is true, as a result, the output of comparator is reversed from "H" to "L", then the output voltage is equal to the pull-up voltage. The voltage level of Point B means a released voltage ($+V_{DET}$).
- *) The difference between a released voltage and a detector threshold voltage is a detector threshold hysteresis.

- Operation of R3116xxx1C

Block Diagram (R3116xxx1C)

Step	1	2	3	4	5

Comparator Output	L	H	Indefinite	H	L
Tr.1	OFF	ON	Indefinite	ON	OFF
Output Tr.	Pch	ON	OFF	Indefinite	OFF
	Nch	OFF	ON	Indefinite	ON

Operation Diagram

- Explanation of operation

- Step 1. The output voltage is equal to the supply voltage (V_{DD}).
- Step 2. At Point "A", $V_{ref} \geq V_{DD} \times (R_b + R_c) / (R_a + R_b + R_c)$ is true, as a result, the output of comparator is reversed from "L" to "H", therefore the output voltage becomes the GND level. The voltage level of Point A means a detector threshold voltage ($-V_{DET}$).
- Step 3. When the supply voltage is lower than the minimum operating voltage, the operation of the output transistor becomes indefinite.
- Step 4. The output voltage is equal to the GND level.
- Step 5. At Point "B", $V_{ref} \leq V_{DD} \times R_b / (R_a + R_b)$ is true, as a result, the output of comparator is reversed from "H" to "L", then the output voltage is equal to the supply voltage (V_{DD}). The voltage level of Point B means a released voltage ($+V_{DET}$).
- *) The difference between a released voltage and a detector threshold voltage is a detector threshold hysteresis.

Detector Operation vs. glitch input voltage to the VDD pin

When the R3116x is at released, if the pulse voltage which the detector threshold or lower voltage, the graph below means that the relation between pulse width and the amplitude of the swing to keep the released state for the R3116x.

*Vod: Over Drive Voltage

This graph shows the maximum pulse conditions to keep the released voltage. If the pulse with larger amplitude or wider width than the graph above, is input to V_{DD} pin, the reset signal may be output.

Input Voltage to CPU

Case2. Input Voltage to R3116xxx1A is unequal to
Input Voltage to CPU

- **R3116xxx1C CPU Reset Circuit 2 (CMOS Output)**

- **Memory Back-up Circuit**

R3116x

- **Voltage level Indicator Circuit (lighted when the power runs out)
(Nch Open Drain Output)**

- **Detector Threshold Adjustable Circuit 1
(Nch Open Drain Output)**

$$\text{Adjustable Detector Threshold} = (-V_{DET}) \times (R_a + R_b) / R_b$$

$$\text{Hysteresis Voltage} = (V_{HYS}) \times (R_a + R_b) / R_b$$

- *1) To prevent oscillation, set $R_a \leq 1\text{k}\Omega$, $R_b \leq 100\Omega$.
- *2) If the value of R_a is set excessively large, voltage drop may occur caused by the supply current of IC itself, and detector threshold and hysteresis voltage may vary.
- *3) If V_{up} and V_{DD} are connected, the voltage dropdown caused by R_{up} , may cause difference in the hysteresis voltage.

- **Detector Threshold Adjustable Circuit 2
(Nch Open Drain Output)**

$$\text{Adjustable Detector Threshold} = (-V_{DET}) \times (R_a + R_b) / R_b$$

$$\text{Hysteresis Voltage} = (V_{HYS}) \times (R_a + R_b) / R_b$$

- *1) To prevent oscillation, set $R_a \leq 10\text{k}\Omega$, $R_b \leq 1\text{k}\Omega$, $C \geq 1\mu\text{F}$.
- *2) If the value of R_a is set excessively large, voltage drop may occur caused by the supply current of IC itself, and detector threshold and hysteresis voltage may vary.
- *3) If V_{up} and V_{DD} are connected, the voltage dropdown caused by R_{up} , may cause difference in the hysteresis voltage.
- *4) If the value of R_a , R_b and C are set excessively large, the delay of the start-up may become too long.

- Window Comparator Circuit
(Nch Open Drain Output)

- Over-charge Preventing Circuit

TECHNICAL NOTES

When R3116xxx1A/C is used in Figure X, if the value of R1 is set excessively large, the dropdown voltage caused by the consumption current of IC itself, may vary the detector threshold and the release voltage. Also, if the value of R1 is set excessively large, there may be delay in start-up and may cause oscillation generated by cross conduction current.

When R3116xxx1A/C is used in Figure Y, if the value of R1 is set excessively large, the dropdown voltage caused by the consumption current of IC itself, may vary the detector threshold and the released voltage. Also, if the value of R1 and R2 is set excessively large, there may be delay in start-up and may cause oscillation generated by cross conduction current.

When R3116xxx1A/C is used in Figure Z, if the value of R1 is set excessively large, the dropdown voltage caused by the consumption current of IC itself may vary the detector threshold and the release voltage. Also, if the value of R1 is set excessively large, there may be delay in start-up and may cause oscillation generated by cross conduction current. Furthermore, if the value of R1 is set large and the value of R2 is set small, released voltage level may shift and the minimum operating voltage may differ. If the value of R2 is set excessively small from R1, release may not occur and may cause oscillation.

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, firecontainment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

RICOH COMPANY., LTD. Electronic Devices Company

■Ricoh presented with the Japan Management Quality Award for 1999.
Ricoh continually strives to promote customer satisfaction, and shares the achievements of its management quality improvement program with people and society.

■Ricoh awarded ISO 14001 certification.
The Ricoh Group was awarded ISO 14001 certification, which is an international standard for environmental management systems, at both its domestic and overseas production facilities. Our current aim is to obtain ISO 14001 certification for all of our business offices.
